1.1	Why Choose wolfSSL?	11
2	Building wolfSSL	11
2.1	Getting wolfSSL Source Code	11
2.2	Building on *nix	11
2.3	Building on Windows	12
2.3.1	VS 2008	12
2.3.2	VS 2010	12
2.3.3	VS 2013 (64 bit solution)	12
2.3.4	Cygwin	13
2.4	Building in a non-standard environment	13
2.4.1	Building into Yocto Linux	14
2.4.2	Building with Atollic TrueSTUDIO	15
2.4.3	Removing Features	15
2.4.4	Enabling Features Disabled by Default	16
2.4.5	Customizing or Porting wolfSSL	20
2.4.6	Reducing Memory or Code Usage	22
2.4.7	Increasing Performance	23
2.4.8	GCM Performance Tuning	23
2.4.9	wolfSSL's proprietary Single Precision math support	23
2.4.10	Stack or Chip Specific Defines	24
2.4.11	OS Specific Defines	26
2.5	Build Options	26
2.5.1	--enable-debug	26
2.5.2	--enable-distro	26
2.5.3	--enable-singlethread	26
2.5.4	--enable-dtls	26
2.5.5	--disable-rng	26
2.5.6	--enable-sctp	26
2.5.7	--enable-openssh	27
2.5.8	--enable-apachehttpd	27
2.5.9	--enable-openvpn	27
2.5.10	--enable-opensslextra	27
2.5.11	--enable-opensslall	27
2.5.12	--enable-maxstrength	27
2.5.13	--disable-harden	27
2.5.14	--enable-ipv6	27
2.5.15	--enable-bump	27
2.5.16	--enable-leanpsk	27
2.5.17	--enable-leantls	28
2.5.18	--enable-bigcache	28
2.5.19	--enable-hugecache	28

2.5.20	--enable-smallcache	28
2.5.21	--enable-savesession	28
2.5.22	--enable-savecert	28
2.5.23	--enable-atomicuser	28
2.5.24	--enable-pkcallbacks	28
2.5.25	--enable-sniffer	29
2.5.26	--enable-aesgcm	29
2.5.27	--enable-aesccm	29
2.5.28	--disable-aescbc	29
2.5.29	--enable-aescfb	29
2.5.30	--enable-aesctr	29
2.5.31	--enable-aesni	30
2.5.32	--enable-intelasm	30
2.5.33	--enable-camellia	30
2.5.34	--enable-md2	30
2.5.35	--enable-nullcipher	30
2.5.36	--enable-ripemd	30
2.5.37	--enable-blake2	30
2.5.38	--enable-blake2s	30
2.5.39	--enable-sha3	30
2.5.40	--enable-sha512	30
2.5.41	--enable-sessioncerts	31
2.5.42	--enable-keygen	31
2.5.43	--enable-certgen	31
2.5.44	--enable-certreq	31
2.5.45	--enable-sep	31
2.5.46	--enable-hkdf	31
2.5.47	--enable-x963kdf	31
2.5.48	--enable-dsa	31
2.5.49	--enable-eccshamir	31
2.5.50	--enable-ecc	31
2.5.51	--enable-ecccustcurves	31
2.5.52	--enable-compkey	32
2.5.53	--enable-curve25519	32
2.5.54	--enable-ed25519	32
2.5.55	--enable-fpecc	32
2.5.56	--enable-eccencrypt	32
2.5.57	--enable-psk	32
2.5.58	--disable-errorstrings	32
2.5.59	--disable-oldtls	32
2.5.60	--enable-sslv3	32
2.5.61	--enable-stacksize	32
2.5.62	--disable-memory	32
2.5.63	--disable-rsa	33
2.5.64	--enable-rsapss	33
2.5.65	--disable-dh	33
2.5.66	--enable-anon	33
2.5.67	--disable-asn	33
2.5.68	--disable-aes	33
2.5.69	--disable-coding	33
2.5.70	--enable-base64encode	33
2.5.71	--disable-des3	33
2.5.72	--enable-idea	33
2.5.73	--enable-arc4	33

2.5.74 --disable-md5	33
2.5.75 --disable-sha	33
2.5.76 --enable-webserver	34
2.5.77 --enable-hc128	34
2.5.78 --enable-rabbit	34
2.5.79 --enable-fips	34
2.5.80 --enable-sha224	34
2.5.81 --disable-poly1305	34

2.5.115 --enable-pwdbased	37
2.5.116 --enable-scrypt	37
2.5.117 --enable-cryptonly	37
2.5.118 --enable-fastmath	37
2.5.119 --enable-fasthugemath	38
2.5.120 --disable-examples	38
2.5.121 --disable-crypttests	38
2.5.122 --enable-fast-rsa	38
2.5.123 --enable-staticmemory	39
2.5.124 --enable-mcapi	39
2.5.125 --enable-asynccrypt	39
2.5.126 --enable-sessionexport	39
2.5.127 --enable-aeskeywrap	39

2.5.128--enable-jobserver	39
2.5.129--enable-shared[=PKGS]	39
2.5.130--enable-static[=PKGS]	39
2.5.131--with-ntru=PATH	39
2.5.132--with-libz=PATH	39
2.5.133--with-cavium	40
2.5.134--with-user-crypto	40
2.5.135--enable-rsavyf	40
2.5.136--enable-rsapub	40
2.5.137--enable-sp	40
2.5.138--enable-sp-asm	40
2.5.139--enable-armasm	40
2.5.140--disable-tls12	40
2.5.141--enable-tls13	40
2.5.142--enable-all	40
2.5.143--enable-xts	40
2.5.144--enable-asio	41
2.5.145--enable-qt	41
2.5.146--enable-qt-test	41
2.5.147--enable-apache-httpd	41
2.5.148--enable-afalg	41
2.5.149--enable-devcrypto	41
2.5.150--enable-mcast	41
2.5.151--disable-pkcs12	41
2.5.152--enable-fallback-scsv	41
2.5.153--enable-psk-one-id	42
2.6 Cross Compiling	42
2.6.1 Example cross compile configure options for toolchain builds	42
2.7 2.7 Building Ports	44
3 Getting Started	45
3.1 General Description	45
3.2 Testsuite	45
3.3 Client Example	47
3.4 Server Example	49
3.5 EchoServer Example	50
3.6 EchoClient Example	51
3.7 Benchmark	51
3.7.1 Relative Performance	52
3.7.2 Benchmarking Notes	53
3.7.3 Benchmarking on Embedded Systems	54
3.8 Changing a Client Application to Use wolfSSL	54
3.9 Changing a Server Application to Use wolfSSL	56
4 Features	56
4.1 Features Overview	56
4.2 Protocol Support	56
4.2.1 Server Functions	57
4.2.2 Client Functions	57
4.2.3 Robust Client and Server Downgrade	57
4.2.4 IPv6 Support	57
4.2.5 DTLS	58
4.2.6 LwIP (Lightweight Internet Protocol)	58
4.2.7 TLS Extensions	58

4.3	Cipher Support	59
4.3.1	Cipher Suite Strength and Choosing Proper Key Sizes	59
4.3.2	Supported Cipher Suites	60
4.3.3	AEAD Suites	63
4.3.4	Block and Stream Ciphers	63
4.3.5	Hashing Functions	64
4.3.6	Public Key Options	64
4.3.7	ECC Support	64
4.3.8	PKCS Support	65
4.3.9	Forcing the Use of a Specific Cipher	67
4.3.10	Quantum-Safe Handshake Ciphersuite	67
4.4	Hardware Accelerated Crypto	67
4.4.1	AES-NI	67
4.4.2	STM32F2	68
4.4.3	Cavium NITROX	68
4.4.4	ESP32-WROOM-32	68
4.5	SSL Inspection (Sniffer)	69
4.6	Compression	70
4.7	Pre-Shared Keys	70
4.8	Client Authentication	71
4.9	Server Name Indication	71
4.10	Handshake Modifications	72
4.10.1	Grouping Handshake Messages	72
4.11	Truncated HMAC	72

1 Introduction

This manual is written as a technical guide to the wolfSSL embedded SSL/TLS library. It will explain how to build and get started with wolfSSL, provide an overview of build options, features, portability enhancements, support, and much more.

1.1 Why Choose wolfSSL?

There are many reasons to choose wolfSSL as your embedded SSL solution. Some of the top reasons include size (typical footprint sizes range from 20-100 kB), support for the newest standards (SSL 3.0, TLS 1.0, TLS 1.1, TLS 1.2, TLS 1.3, DTLS 1.0, and DTLS 1.2), current and progressive cipher support (including stream ciphers), multi- platform, royalty free, and an OpenSSL compatibility API to ease porting into existing applications which have previously used the OpenSSL package. For a complete feature list, see [Features Overview](#).

2 Building wolfSSL

wolfSSL was written with portability in mind and should generally be easy to build on most systems. If you have difficulty building wolfSSL, please don't hesitate to seek support through our support forums (<https://www.wolfssl.com/forums>) or contact us directly at support@wolfssl.com.

This chapter explains how to build wolfSSL on Unix and Windows, and provides guidance for building wolfSSL in a non-standard environment. You will find the "getting started" guide in [Chapter 3](#) and an SSL tutorial in [Chapter 11](#).

When using the autoconf / automake system to build wolfSSL, wolfSSL uses a single Makefile to build all parts and examples of the library, which is both simpler and faster than using Makefiles recursively.

2.1 Getting wolfSSL Source Code

The most recent version of wolfSSL can be downloaded from the wolfSSL website as a ZIP file:

<https://www.wolfssl.com/download>

After downloading the ZIP file, unzip the file using the unzip command. To use native line endings, enable the -a modifier when using unzip. From the unzip man page, the -a modifier functionality is described:

[...] The -a option causes files identified by zip as text files (those with the 't' label in zipinfo listings, rather than 'b') to be automatically extracted as such, converting line endings, end-of-file characters and the character set itself as necessary. [...]

NOTE: Beginning with the release of wolfSSL 2.0.0rc3, the directory structure of wolfSSL was changed as well as the standard install location. These changes were made to make it easier for open source projects to integrate wolfSSL. For more information on header and structure changes, please see [Library Headers](#) and [Structure Usage](#).

2.2 Building on *nix

When building wolfSSL on Linux, *BSD, OS X, Solaris, or other *nix-like systems, use the autoconf system. To build wolfSSL you only need to run two commands from the wolfSSL root directory, `./configure` and `make`.

The `./configure` script sets up the build environment and you can append any number of build options to `./configure`. For a list of available build options, please see [Build Options](#) or run the following the command line to see a list of possible options to pass to the `./configure` script:

```
./configure --help
```

Once `./configure` has successfully executed, to build wolfSSL, run:

```
make
```

To install wolfSSL run:

```
make install
```

You may need superuser privileges to install, in which case precede the command with sudo:

```
sudo make install
```

To test the build, run the testsuite program from the root wolfSSL directory:

```
./testsuite/testsuite.test
```

Alternatively you can use autoconf to run the testsuite as well as the standard wolfSSL API and crypto tests:

```
make test
```

Further details about expected output of the testsuite program can be found in the [Testsuite section](#). If you want to build only the wolfSSL library and not the additional items (examples, testsuite, benchmark app, etc.), you can run the following command from the wolfSSL root directory:

```
make src/libwolfssl.la
```

2.3 Building on Windows

In addition to the instructions below, you can find instructions and tips for building wolfSSL with Visual Studio [here](#).

2.3.1 VS 2008

Solutions are included for Visual Studio 2008 in the root directory of the install. For use with Visual Studio 2010 and later, the existing project files should be able to be converted during the import process.

Note: If importing to a newer version of VS you will be asked: "Do you want to overwrite the project and its imported property sheets?" You can avoid the following by selecting "No". Otherwise if you select "Yes", you will see warnings about EDITANDCONTINUE being ignored due to SAFEH specification. You will need to right click on the testsuite, sslSniffer, server, echoserver, echoclient, and client individually and modify their Properties->Configuration Properties->Linker->Advanced (scroll all the way to the bottom in Advanced window). Locate "Image Has Safe Exception Handlers" and click the drop down arrow on the far right. Change this to No (/SAFESEH:NO) for each of the aforementioned. The other option is to disable EDITANDCONTINUE which, we have found to be useful for debugging purposes and is therefore not recommended.

2.3.2 VS 2010

You will need to download Service Pack 1 to build wolfSSL solution once it has been updated. If VS reports a linker error, clean and rebuild the project; the linker error should be taken care of.

2.3.3 VS 2013 (64 bit solution)

You will need to download Service Pack 4 to build wolfSSL solution once it has been updated. If VS reports a linker error, clean the project then Rebuild the project and the linker error should be taken care of.

To test each build, choose "Build All" from the Visual Studio menu and then run the testsuite program. To edit build options in the Visual Studio project, select your desired project (wolfssl, echoclient, echoserver, etc.) and browse to the "Properties" panel.

Note: After the wolfSSL v3.8.0 release the build preprocessor macros were moved to a centralized file located at IDE/WIN/user_settings.h. This file can also be found in the project. To add fea-

tures such as ECC or ChaCha20/Poly1305 add #defines here such as HAVE_ECC or HAVE_CHACHA / HAVE_POLY1305.

2.3.4 Cygwin

If building wolfSSL for Windows on a Windows development machine, we recommend using the included Visual Studio project files to build wolfSSL. However if Cygwin is required here is a short guide on how our team achieved a successful build:

1. Go to <https://www.cygwin.com/install.html> and download setup-x86_64.exe
2. Run setup-x86_64.exe and install however you choose. Click through the installation menus until you reach the "Select Packages" stage.
3. Click on the "+" icon to expand "All"
4. Now go to the "Archive" section and select "unzip" drop down, change "Skip" to 6.0-15 (or some other version).
5. Under "Devel" click "autoconf" drop down and change "Skip" to "10-1" (or some other version)
6. Under "Devel" click "automake" drop down and change "Skip" to "10-1" (or some other version)
7. Under "Devel" click the "gcc-core" drop down and change "Skip" to 7.4.0-1 (NOTE: wolfSSL has not tested GCC 9 or 10 and as they are fairly new does not recommend using them until they have had a bit more time to be fine-tuned for development).
8. Under "Devel" click the "git" drop down and change "Skip" to 2.29.0-1 (or some other version)
9. Under "Devel" click "libtool" drop down and change "Skip" to "2.4.6-5" (or some other version)
10. Under "Devel" click the "make" drop down and change "Skip" to 4.2.1-1 (or some other version)
11. Click "Next" and proceed through the rest of the installation.

The additional packages list should include:

- unzip
- autoconf
- automake
- gcc-core
- git
- libtool
- make

2.3.4.1 Post Install Open a Cygwin terminal and clone wolfSSL:

```
git clone https://github.com/wolfssl/wolfssl.git
cd wolfssl
./autogen.sh
./configure
make
make check
```

2.4 Building in a non-standard environment

While not officially supported, we try to help users wishing to build wolfSSL in a non-standard environment, particularly with embedded and cross-compilation systems. Below are some notes on getting started with this.

1. The source and header files need to remain in the same directory structure as they are in the wolfSSL download package.
2. Some build systems will want to explicitly know where the wolfSSL header files are located, so you may need to specify that. They are located in the <wolfssl_root>/wolfssl directory. Typically, you can add the <wolfssl_root> directory to your include path to resolve header problems.

3. wolfSSL defaults to a little endian system unless the configure process detects big endian. Since users building in a non-standard environment aren't using the configure process, `BIG_ENDIAN_ORDER` will need to be defined if using a big endian system.
4. wolfSSL benefits speed-wise from having a 64-bit type available. The configure process determines if long or long long is 64 bits and if so sets up a define. So if `sizeof(long)` is 8 bytes on your system, define `SIZEOF_LONG 8`. If it isn't but `sizeof(long long)` is 8 bytes, then define `SIZEOF_LONG_LONG 8`.
5. Try to build the library, and let us know if you run into any problems. If you need help, contact us at info@wolfssl.com.
6. Some defines that can modify the build are listed in the following sub-sections, below. For more verbose descriptions of many options, please see [Build Options](#).

2.4.1 Building into Yocto Linux

wolfSSL also includes recipes for building wolfSSL on Yocto Linux and OpenEmbedded. These recipes are maintained within the meta-wolfSSL layer as a GitHub repository, here: <https://github.com/wolfSSL/meta-wolfssl>. Building wolfSSL on Yocto Linux will require Git and bitbake. The following steps list how to get some wolfSSL products (that recipes exist for) built on Yocto Linux.

1. Cloning wolfSSL meta

This can be done through a git-clone command of the following URL: <https://github.com/wolfSSL/meta-wolfssl>

2. Insert the "meta-wolfSSL" layer into the build's bblayers.conf

Within the BBLAYERS section, add the path to the location where meta-wolfssl was cloned into. Example:

```
BBLAYERS += "... \
/path/to/meta-wolfssl/ \
..."
```

3. Build a wolfSSL product recipe

bitbake can be used to build one of the three following wolfSSL product recipes: *wolfssl*, *wolfssh*, and *wolfmqtt*. Simply pass one of those recipes into the bitbake command (example: `bitbake wolfssl`). This allows the user to personally confirm compilation succeeds without issues.

4. Edit local.conf

The final step is to edit the build's local.conf file, which allows desired libraries to be included with the image being built. Edit the `IMAGE_INSTALL_append` line to include the name of the desired recipe(s). An example of this is shown below:

```
IMAGE_INSTALL_append = "wolfssl wolfssh wolfmqtt"
```

Once the image has been built, wolfSSL's default location (or related products from recipes) will be the `/usr/lib/` directory.

Additionally, wolfSSL can be customized when building into Yocto by using the enable and disable options listed in [Build Options](#). This requires creating a `.bbappend` file and placing it within the wolfSSL application/recipe layer. The contents of this file should include a line specifying content to concatenate onto the `EXTRA_OECONF` variable. An example of this is shown below to enable TLS 1.3 support through the TLS 1.3 enable option:

```
EXTRA_OECONF += "--enable-tls13"
```

Further documentation on building into Yocto can be found in the meta-wolfssl README, located here: <https://github.com/wolfSSL/meta-wolfssl/blob/master/README.md>

2.4.2 Building with Atollic TrueSTUDIO

Versions of wolfSSL following 3.15.5 include a TrueSTUDIO project file that is used to build wolfSSL on ARM M4-Cortex devices. The TrueSTUDIO project file simplifies the process of building on STM32 devices, is free to download, and is created by Atollic - a part of ST Microelectronics. To build the wolfSSL static library project file in TrueSTUDIO, it will require the user perform the following steps after opening TrueSTUDIO:

1. Import the project into the workspace (File > Import)
2. Build the project (Project > Build project)

The build then includes the settings located inside of `user_settings.h` at build-time. The default content of the `user_settings.h` file is minimal, and does not contain many features. Users are able to modify this file and add or remove features with options listed in the remainder of this chapter.

2.4.3 Removing Features

The following defines can be used to remove features from wolfSSL. This can be helpful if you are trying to reduce the overall library footprint size. In addition to defining a `NO_<feature-name>` define, you can also remove the respective source file as well from the build (but not the header file).

2.4.3.1 NO_WOLFSSL_CLIENT Removes calls specific to the client and is for a server-only builds. You should only use this if you want to remove a few calls for the sake of size.

2.4.3.2 NO_WOLFSSL_SERVER Likewise removes calls specific to the server side.

2.4.3.3 NO_DES3 Removes the use of DES3 encryptions. DES3 is built-in by default because some older servers still use it and it's required by SSL 3.0. `NO_DH` and `NO_AES` are the same as the two above, they are widely used.

2.4.3.4 NO_DSA Removes DSA since it's being phased out of popular use.

2.4.3.5 NO_ERROR_STRINGS Disables error strings. Error strings are located in `src/internal.c` for wolfSSL or `wolfcrypt/src/asn.c` for wolfCrypt.

2.4.3.6 NO_HMAC Removes HMAC from the build.

NOTE: SSL/TLS depends on HMAC but if you are only using wolfCrypt IE build option `WOLFCRYPT_ONLY` then HMAC can be disabled in this case.

2.4.3.7 NO_MD4 Removes MD4 from the build, MD4 is broken and shouldn't be used.

2.4.3.8 NO_MD5 Removes MD5 from the build.

2.4.3.9 NO_SHA Removes SHA-1 from the build.

2.4.3.10 NO_SHA256 Removes SHA-256 from the build.

2.4.3.11 NO_PSK Turns off the use of the pre-shared key extension. It is built-in by default.

2.4.3.12 NO_PWDBASED Disables password-based key derivation functions such as PBKDF1, PBKDF2, and PBKDF from PKCS #12.

2.4.3.13 NO_RC4 Removes the use of the ARC4 stream cipher from the build. ARC4 is built-in by default because it is still popular and widely used.

2.4.3.14 NO_RABBIT and NO_HC128 Remove stream cipher extensions from the build.

2.4.3.15 NO_SESSION_CACHE Can be defined when a session cache is not needed. This should reduce memory use by nearly 3 kB.

2.4.3.16 NO_TLS Turns off TLS. We don't recommend turning off TLS.

2.4.3.17 SMALL_SESSION_CACHE Can be defined to limit the size of the SSL session cache used by wolfSSL. This will reduce the default session cache from 33 sessions to 6 sessions and save approximately 2.5 kB.

2.4.3.18 NO_RSA Removes support for the RSA algorithm.

2.4.3.19 WC_NO_RSA_OAEP Removes code for OAEP padding.

2.4.3.20 NO_AES_CBC Turns off AES-CBC algorithm support.

2.4.3.21 NO_DEV_URANDOM Disables the use of /dev/urandom

2.4.3.22 WOLFSSL_NO_SIGALG Disables the signature algorithms extension

2.4.3.23 NO_RESUME_SUITE_CHECK Disables the check of cipher suite when resuming a TLS connection

2.4.3.24 NO_ASN Removes support for ASN formatted certificate processing.

2.4.3.25 NO_OLD_TLS Removes support for SSLv3, TLSv1.0 and TLSv1.1

2.4.3.26 WOLFSSL_AEAD_ONLY Removes support for non-AEAD algorithms. AEAD stands for “authenticated encryption with associated data” which means these algorithms (such as AES-GCM) do not just encrypt and decrypt data, they also assure confidentiality and authenticity of that data.

2.4.4 Enabling Features Disabled by Default

2.4.4.1 WOLFSSL_CERT_GEN Turns on wolfSSL's certificate generation functionality. See [Keys and Certificates](#) for more information.

2.4.4.2 WOLFSSL_DER_LOAD Allows loading DER-formatted CA certs into the wolfSSL context (WOLFSSL_CTX) using the function [wolfSSL_CTX_der_load_verify_locations\(\)](#).

2.4.4.3 WOLFSSL_DTLS Turns on the use of DTLS, or datagram TLS. This isn't widely supported or used.

2.4.4.4 WOLFSSL_KEY_GEN Turns on wolfSSL's RSA key generation functionality. See [Keys and Certificates](#) for more information.

2.4.4.5 WOLFSSL_RIPEMD Enables RIPEMD-160 support.

2.4.4.6 WOLFSSL_SHA384 Enables SHA-384 support.

2.4.4.7 WOLFSSL_SHA512 Enables SHA-512 support.

2.4.4.8 DEBUG_WOLFSSL Builds in the ability to debug. For more information regarding debugging wolfSSL, see [Debugging](#).

2.4.4.9 HAVE_AESCCM Enables AES-CCM support.

2.4.4.10 HAVE_AESGCM Enables AES-GCM support.

2.4.4.11 WOLFSSL_AES_XTS Enables AES-XTS support.

2.4.4.12 HAVE_CAMELLIA Enables Camellia support.

2.4.4.13 HAVE_CHACHA Enables ChaCha20 support.

2.4.4.14 HAVE_POLY1305 Enables Poly1305 support.

2.4.4.15 HAVE_CRL Enables Certificate Revocation List (CRL) support.

2.4.4.16 HAVE_CRL_IO Enables blocking inline HTTP request on the CRL URL. It will load the CRL into the WOLFSSL_CTX and apply it to all WOLFSSL objects created from it.

2.4.4.17 HAVE_ECC Enables Elliptical Curve Cryptography (ECC) support.

2.4.4.18 HAVE_LIBZ Is an extension that can allow for compression of data over the connection. It normally shouldn't be used, see the note below under configure notes libz.

2.4.4.19 HAVE_OCSP Enables Online Certificate Status Protocol (OCSP) support.

2.4.4.20 OPENSSL_EXTRA Builds even more OpenSSL compatibility into the library, and enables the wolfSSL OpenSSL compatibility layer to ease porting wolfSSL into existing applications which had been designed to work with OpenSSL. It is off by default.

2.4.4.21 TEST_IPV6 Turns on testing of IPv6 in the test applications. wolfSSL proper is IP neutral, but the testing applications use IPv4 by default.

2.4.4.22 HAVE_CSHARP Turns on configuration options needed for C# wrapper.

2.4.4.23 HAVE_CURVE25519 Turns on the use of curve25519 algorithm.

2.4.4.24 HAVE_ED25519 Turns on use of the ed25519 algorithm.

2.4.4.25 WOLFSSL_DH_CONST Turns off use of floating point values when performing Diffie Hellman operations and uses tables for `XPOW()` and `XLOG()`. Removes dependency on external math library.

2.4.4.26 WOLFSSL_TRUST_PEER_CERT Turns on the use of trusted peer certificates. This allows for loading in a peer certificate to match with a connection rather than using a CA. When turned on if a trusted peer certificate is matched then the peer cert chain is not loaded and the peer is considered verified. Using CAs is preferred.

2.4.4.27 WOLFSSL_STATIC_MEMORY Turns on the use of static memory buffers and functions. This allows for using static memory instead of dynamic.

2.4.4.28 WOLFSSL_SESSION_EXPORT Turns on the use of DTLS session export and import. This allows for serializing and sending/receiving the current state of a DTLS session.

2.4.4.29 WOLFSSL_ARMASM Turns on the use of ARMv8 hardware acceleration.

2.4.4.30 WC_RSA_NONBLOCK Turns on fast math RSA non-blocking support for splitting RSA operations into smaller chunks of work. Feature is enabled by calling `wc_RsaSetNonBlock()` and checking for `FP_WOULDBLOCK` return code.

2.4.4.31 WOLFSSL_RSA_VERIFY_ONLY Turns on small build for RSA verify only use. Should be used with the macros `WOLFSSL_RSA_PUBLIC_ONLY`, `WOLFSSL_RSA_VERIFY_INLINE`, `NO_SIG_WRAPPER`, and `WOLFCRYPT_ONLY`.

2.4.4.32 WOLFSSL_RSA_PUBLIC_ONLY Turns on small build for RSA public key only use. Should be used with the macro `WOLFCRYPT_ONLY`.

2.4.4.33 WOLFSSL_SHA3 Turns on build for SHA3 use. This is support for SHA3 Keccak for the sizes SHA3-224, SHA3-256, SHA3-384 and SHA3-512. In addition `WOLFSSL_SHA3_SMALL` can be used to trade off performance for resource use.

2.4.4.34 USE_ECDSA_KEYSZ_HASH_ALGO Will choose a hash algorithm that matches the ephemeral ECDHE key size or the next highest available. This workaround resolves issues with some peers that do not properly support scenarios such as a P-256 key hashed with SHA512.

2.4.4.35 WOLFSSL_ALT_CERT_CHAIN Allows CA's to be presented by peer, but not part of a valid chain. Default wolfSSL behavior is to require validation of all presented peer certificates. This also allows loading intermediate CA's as trusted and ignoring no signer failures for CA's up the chain to root. The alternate certificate chain mode only requires that the peer certificate validate to a trusted CA.

2.4.4.36 WOLFSSL_CUSTOM_CURVES Allow non-standard curves. Includes the curve "a" variable in calculation. Additional curve types can be enabled using `HAVE_ECC_SECP224K1`, `HAVE_ECC_SECP256K1`, `HAVE_ECC_BRAINPOOL` and `HAVE_ECC_KOBLITZ`.

2.4.4.37 HAVE_COMP_KEY Enables ECC compressed key support.

2.4.4.38 WOLFSSL_EXTRA_ALERTS Enables additional alerts to be sent during a TLS connection. This feature is also enabled automatically when `--enable-opensslextra` is used.

2.4.4.39 WOLFSSL_DEBUG_TLS Enables additional debugging print outs during a TLS connection

2.4.4.40 HAVE_BLAKE2 Enables Blake2s algorithm support

2.4.4.41 HAVE_FALLBACK_SCSV Enables Signaling Cipher Suite Value(SCSV) support on the server side. This handles the cipher suite 0x56 0x00 sent from a client to signal that no downgrade of TLS version should be allowed.

2.4.4.42 WOLFSSL_PSK_ONE_ID Enables support for only one PSK ID with TLS 1.3.

2.4.4.43 SHA256_MANY_REGISTERS A SHA256 version that keeps all data in registers and partially unrolls loops.

2.4.4.44 WOLFCRYPT_HAVE_SRP Enables wolfcrypt secure remote password support

2.4.4.45 WOLFSSL_MAX_STRENGTH Enables the strongest security features only and disables any weak or deprecated features. Results in slower performance due to near constant time execution to protect against timing based side-channel attacks.

2.4.4.46 HAVE_QSH Turns on support for cipher suites resistant to Shor's algorithm. QSH stands for "Quantum Safe Handshake".

2.4.4.47 WOLFSSL_STATIC_RSA Static ciphers are strongly discouraged and should never be used if avoidable. However there are still legacy systems that ONLY support static cipher suites. To that end if you need to connect to a legacy peer only supporting static RSA cipher suites use this to enable support for static RSA in wolfSSL. (See also `WOLFSSL_STATIC_PSK` and `WOLFSSL_STATIC_DH`)

2.4.4.48 WOLFSSL_STATIC_PSK Static ciphers are highly discouraged see `WOLFSSL_STATIC_RSA`

2.4.4.49 WOLFSSL_STATIC_DH Static ciphers are highly discouraged see `WOLFSSL_STATIC_RSA`

2.4.4.50 HAVE_NTRU Turns on support for NTRU cipher suites. NTRU offers a Quantum resistant Public Key solution. Read more about it on the WIKI page: <https://en.wikipedia.org/wiki/NTRU>

2.4.4.51 HAVE_NULL_CIPHER Turns on support for NULL ciphers. This option is highly discouraged from a security standpoint however some systems are too small to perform encrypt/decrypt operations and it is better to at least authenticate messages and peers to prevent message tampering than nothing at all!

2.4.4.52 HAVE_ANON Turns on support for anonymous cipher suites. (Never recommended, some valid use cases involving closed or private networks detached from the web)

2.4.5 Customizing or Porting wolfSSL

2.4.5.1 WOLFSSL_USER_SETTINGS If defined allows a user specific settings file to be used. The file must be named `user_settings.h` and exist in the include path. This is included prior to the standard `settings.h` file, so default settings can be overridden.

2.4.5.2 WOLFSSL_CALLBACKS Is an extension that allows debugging callbacks through the use of signals in an environment without a debugger, it is off by default. It can also be used to set up a timer with blocking sockets. Please see [Callbacks](#) for more information.

2.4.5.3 WOLFSSL_USER_IO Allows the user to remove automatic setting of the default I/O functions `EmbedSend()` and `EmbedReceive()`. Used for custom I/O abstraction layer (see [Abstraction Layers](#) for more details).

2.4.5.4 NO_FILESYSTEM Is used if stdio isn't available to load certificates and key files. This enables the use of buffer extensions to be used instead of the file ones.

2.4.5.5 NO_INLINE Disables the automatic inlining of small, heavily used functions. Turning this on will slow down wolfSSL and actually make it bigger since these are small functions, usually much smaller than function call setup/return. You'll also need to add `wolfcrypt/src/misc.c` to the list of compiled files if you're not using autoconf.

2.4.5.6 NO_DEV_RANDOM Disables the use of the default `/dev/random` random number generator. If defined, the user needs to write an OS-specific `GenerateSeed()` function (found in `wolfcrypt/src/random.c`).

2.4.5.7 NO_MAIN_DRIVER Is used in the normal build environment to determine whether a test application is called on its own or through the testsuite driver application. You'll only need to use it with the test files: `test.c`, `client.c`, `server.c`, `echoclient.c`, `echoserver.c`, and `testsuite.c`

2.4.5.8 NO_WRITEV Disables simulation of `writev()` semantics.

2.4.5.9 SINGLE_THREADED Is a switch that turns off the use of mutexes. wolfSSL currently only uses one for the session cache. If your use of wolfSSL is always single threaded you can turn this on.

2.4.5.10 USER_TICKS Allows the user to define their own clock tick function if `time(0)` is not wanted. Custom function needs second accuracy, but doesn't have to be correlated to Epoch. See `LowResTimer()` function in `wolfssl_int.c`.

2.4.5.11 USER_TIME Disables the use of `time.h` structures in the case that the user wants (or needs) to use their own. See `wolfcrypt/src/asn.c` for implementation details. The user will need to define and/or implement `XTIME()`, `XGMTIME()`, and `XVALIDATE_DATE()`.

2.4.5.12 USE_CERT_BUFFERS_1024 Enables 1024-bit test certificate and key buffers located in `<wolfssl_root>/wolfssl/certs_test.h`. Helpful when testing on and porting to embedded systems with no filesystem.

2.4.5.13 USE_CERT_BUFFERS_2048 Enables 2048-bit test certificate and key buffers located in <wolfssl_root>/wolfssl/certs_test.h. Helpful when testing on and porting to embedded systems with no filesystem.

2.4.5.14 CUSTOM_RAND_GENERATE_SEED Allows user to define custom function equivalent to wc_GenerateSeed(byte* output, word32 sz).

2.4.5.15 CUSTOM_RAND_GENERATE_BLOCK Allows user to define custom random number generation function. Examples of use are as follows.

```
./configure --disable-hashdrbg  
CFLAGS="-DCUSTOM_RAND_GENERATE_BLOCK= custom_rand_generate_block"
```

Or

```
/* RNG */  
/* #define HAVE_HASHDRBG */  
extern int custom_rand_generate_block(unsigned char* output, unsigned int sz);
```

2.4.5.16 NO_PUBLIC_GCM_SET_IV Use this if you have done your own custom hardware port and not provided a public implementation of wc_AesGcmSetIV()

2.4.5.17 NO_PUBLIC_CCM_SET_NONCE Use this if you have done your own custom hardware port and not provided a public implementation of wc_AesGcmSetNonce()

2.4.5.18 NO_GCM_ENCRYPT_EXTRA Use this if you have done your own custom hardware port and not provided an implementation of wc_AesGcmEncrypt_ex()

2.4.5.19 WOLFSSL_STM32[F1 | F2 | F4 | F7 | L4] Use one of these defines when building for the appropriate STM32 device. Update wolfssl-root/wolfssl/wolfcrypt/settings.h section with regards to the wolfSSL porting guide (<https://www.wolfssl.com/docs/porting-guide/>) as appropriate.

2.4.5.20 WOLFSSL_STM32_CUBEMX When using the CubeMX tool to generate Hardware Abstraction Layer (HAL) API's use this setting to add appropriate support in wolfSSL.

2.4.5.21 WOLFSSL_CUBEMX_USE_LL When using the CubeMX tool to generate APIs there are two options, HAL (Hardware Abstraction Layer) or Low Layer (LL). Use this define to control which headers are include in wolfssl-root/wolfssl/wolfcrypt/settings.h in the WOLFSSL_STM32[F1/F2/F4/F7/L4] section.

2.4.5.22 NO_STM32_CRYPT0 For when an STM32 part does not offer hardware crypto support

2.4.5.23 NO_STM32_HASH For when an STM32 part does not offer hardware hash support

2.4.5.24 NO_STM32_RNG For when an STM32 part does not offer hardware RNG support

2.4.5.25 XTIME_MS Macro to map a function for use to get the time in milliseconds when using TLS 1.3. Example being:

```
extern time_t m2mb_xtime_ms(time_t * timer);  
#define XTIME_MS(tl) m2mb_xtime_ms((tl))
```

2.4.6 Reducing Memory or Code Usage

2.4.6.1 TFM_TIMING_RESISTANT Can be defined when using fast math (`USE_FAST_MATH`) on systems with a small stack size. This will get rid of the large static arrays.

2.4.6.2 WOLFSSL_SMALL_STACK Can be used for devices which have a small stack size. This increases the use of dynamic memory in `wolfcrypt/src/integer.c`, but can lead to slower performance.

2.4.6.3 ALT_ECC_SIZE If using fast math and RSA/DH you can define this to reduce your ECC memory consumption. Instead of using stack for ECC points it will allocate from the heap.

2.4.6.4 ECC_SHAMIR Uses variation of ECC math that is slightly faster, but doubles heap usage.

2.4.6.5 RSA_LOW_MEM When defined CRT is not used which saves on some memory but slows down RSA operations. It is off by default.

2.4.6.6 WOLFSSL_SHA3_SMALL When SHA3 is enabled this macro will reduce build size.

2.4.6.7 WOLFSSL_SMALL_CERT_VERIFY Verify the certificate signature without using `DecodedCert`. Doubles up on some code but allows smaller peak heap memory usage. Cannot be used with `WOLFSSL_NONBLOCK_OCSP`.

2.4.6.8 GCM_SMALL Option to reduce AES GCM code size by calculating at runtime instead of using tables. Possible options are: `GCM_SMALL`, `GCM_WORD32` or `GCM_TABLE`.

2.4.6.9 CURVED25519_SMALL Defines `CURVE25519_SMALL` and `ED25519_SMALL`.

2.4.6.10 CURVE25519_SMALL Use small memory option for curve25519. This uses less memory, but is slower.

2.4.6.11 ED25519_SMALL Use small memory option for ed25519. This uses less memory, but is slower.

2.4.6.12 USE_SLOW_SHA Reduces code size by not unrolling loops, which reduces performance for SHA.

2.4.6.13 USE_SLOW_SHA256 Reduces code size by not unrolling loops, which reduces performance for SHA. About 2k smaller and about 25% slower.

2.4.6.14 USE_SLOW_SHA512 Reduces code size by not unrolling loops, which reduces performance for SHA. Over twice as small, but 50% slower.

2.4.6.15 ECC_USER_CURVES Allow user to choose ECC curve sizes that are enabled. Only the 256-bit curve is enabled by default. To enable others use `HAVE_ECC192`, `HAVE_ECC224`, etc...

2.4.6.16 WOLFSSL_SP_SMALL If using SP math this will use smaller versions of the code.

2.4.6.17 WOLFSSL_SP_MATH Enable only SP math to reduce code size. Eliminates big integer math code such as normal (`integer.c`) or fast (`tfm.c`). Restricts key sizes and curves to only ones supported by SP.

2.4.7 Increasing Performance

2.4.7.1 USE_INTEL_SPEEDUP Enables use of Intel's AVX/AVX2 instructions for accelerating AES, ChaCha20, Poly1305, SHA256, SHA512, ED25519 and Curve25519.

2.4.7.2 WOLFSSL_AESNI Enables use of AES accelerated operations which are built into some Intel and AMD chipsets. When using this define, the `aes_asm.asm` (for Windows with at&t syntax) or `aes_asm.S` file is used to optimize via the Intel AES new instruction set (AESNI).

2.4.7.3 HAVE_INTEL_RDSEED Enable Intel's RDSEED for DRBG seed source.

2.4.7.4 HAVE_INTEL_RDRAND Enable Intel's RDRAND instruction for wolfSSL's random source.

2.4.7.5 USE_FAST_MATH Switches the big integer library to a faster one that uses assembly if possible. `fastmath` will speed up public key operations like RSA, DH, and DSA. The big integer library is generally the most portable and generally easiest to get going with, but the negatives to the normal big integer library are that it is slower and it uses a lot of dynamic memory. Because the stack memory usage can be larger when using `fastmath`, we recommend defining `TFM_TIMING_RESISTANT` as well when using this option.

2.4.7.6 FP_ECC Enables ECC Fixed Point Cache, which speeds up repeated operations against same private key. Can also define number of entries and LUT bits using `FP_ENTRIES` and `FP_LUT` to reduce default static memory usage.

2.4.8 GCM Performance Tuning

There are 4 variants of GCM performance:

- `GCM_SMALL` - Smallest footprint, slowest (FIPS validated)
- `GCM_WORD32` - Medium (FIPS validated)
- `GCM_TABLE` - Fast (FIPS validated)
- `GCM_TABLE_4BIT` - Fastest (Not yet FIPS validated, will be included in FIPS 140-3!)

2.4.9 wolfSSL's proprietary Single Precision math support

Use these to speed up public key operations for specific keys sizes and curves that are common. Make sure to include the correct code files such as:

- `sp_c32.c`
- `sp_c64.c`
- `sp_arm32.c`
- `sp_arm64.c`
- `sp_armthumb.c`
- `sp_cortexm.c`
- `sp_int.c`
- `sp_x86_64.c`
- `sp_x86_64_asm.S`

2.4.9.1 WOLFSSL_SP Enable Single Precision math support.

2.4.9.2 WOLFSSL_SP_ASM Enable assembly speedups for Single Precision

2.4.9.3 WOLFSSL_HAVE_SP_RSA Single Precision RSA for 2048, 3072 and 4096 bit.

2.4.9.4 WOLFSSL_HAVE_SP_DH Single Precision DH for 2048, 3072 and 4096 bit.

2.4.9.5 WOLFSSL_HAVE_SP_ECC Single Precision ECC for SECP256R1.

2.4.9.6 WOLFSSL_ASYNC_CRYPT Adds support for Asynchronous Crypto^[^1]

[^1]: Limited Software support, works best with Intel® QuickAssist Technology (Intel® QAT) and Cavium Nitrox V Processors

2.4.10 Stack or Chip Specific Defines

wolfSSL can be built for a variety of platforms and TCP/IP stacks. Most of the following defines are located in `./wolfssl/wolfcrypt/settings.h` and are commented out by default. Each can be uncommented to enable support for the specific chip or stack referenced below.

2.4.10.1 IPHONE Can be defined if building for use with iOS.

2.4.10.2 THREADX Can be defined when building for use with the ThreadX RTOS (<https://www.rtos.com>).

2.4.10.3 MICRIUM Can be defined when building wolfSSL to enable support for Micrium's µC/OS-III RTOS (<https://www.micrium.com>).

2.4.10.4 MBED Can be defined when building for the mbed prototyping platform (<https://www.mbed.org>).

2.4.10.5 MICROCHIP_PIC32 Can be defined when building for Microchip's PIC32 platform (<https://www.microchip.com>).

2.4.10.6 MICROCHIP_TCPIP_V5 Can be defined specifically version 5 of microchip tcp/ip stack.

2.4.10.7 MICROCHIP_TCPIP Can be defined for microchip tcp/ip stack version 6 or later.

2.4.10.8 WOLFSSL_MICROCHIP_PIC32MZ Can be defined for PIC32MZ hardware cryptography engine.

2.4.10.9 FREERTOS Can be defined when building for FreeRTOS (<https://www.freertos.org>). If using LwIP, define `WOLFSSL_LWIP` as well.

2.4.10.10 FREERTOS_WINSIM Can be defined when building for the FreeRTOS windows simulator (<https://www.freertos.org>).

2.4.10.11 EBSNET Can be defined when using EBSnet products and RTIP.

2.4.10.12 WOLFSSL_LWIP Can be defined when using wolfSSL with the LwIP TCP/IP stack (<https://savannah.nongnu.org/projects/lwip/>).

2.4.10.13 WOLFSSL_GAME_BUILD Can be defined when building wolfSSL for a game console.

2.4.10.14 WOLFSSL_LSR Can be defined if building for LSR.

2.4.10.15 FREESCALE_MQX Can be defined when building for Freescale MQX/RTCS/MFS (<https://www.freescale.com>). This in turn defines FREESCALE_K70_RNGA to enable support for the Kinetis H/W Random Number Generator Accelerator

2.4.10.16 WOLFSSL_STM32F2 Can be defined when building for STM32F2. This define also enables STM32F2 hardware crypto and hardware RNG support in wolfSSL (<https://www.st.com/internet/mcu/subclass/1520.jsp>

2.4.10.17 COMVERGE Can be defined if using Comverge settings.

2.4.10.18 WOLFSSL_QL Can be defined if using QL SEP settings.

2.4.10.19 WOLFSSL_EROAD Can be defined building for EROAD.

2.4.10.20 WOLFSSL_IAR_ARM Can be defined if build for IAR EWARM.

2.4.10.21 WOLFSSL_TIRTOS Can be defined when building for TI-RTOS.

2.4.10.22 WOLFSSL_ROWLEY_ARM Can be defined when building with Rowley CrossWorks.

2.4.10.23 WOLFSSL_NRF51 Can be defined when porting to Nordic nRF51.

2.4.10.24 WOLFSSL_NRF51_AES Can be defined to use built-in AES hardware for AES 128 ECB encrypt when porting to Nordic nRF51.

2.4.10.25 WOLFSSL_CONTIKI Can be defined to enable support for the Contiki operating system.

2.4.10.26 WOLFSSL_APACHE_MYNEWT Can be defined to enable the Apache Mynewt port layer.

2.4.10.27 WOLFSSL_APACHE_HTTPD Can be defined to enable support for the Apache HTTPD web server.

2.4.10.28 ASIO_USE_WOLFSSL Can be defined to make wolfSSL build as an ASIO-compatible version. ASIO then relies on the BOOST_ASIO_USE_WOLFSSL preprocessor define.

2.4.10.29 WOLFSSL_CRYPTOCCELL Can be defined to enable using ARM CRYPTOCCELL.

2.4.10.30 WOLFSSL_SIFIVE_RISC_V Can be defined to enable using RISC-V SiFive/HiFive port.

2.4.10.31 WOLFSSL_MDK_ARM Adds support for MDK ARM

2.4.10.32 WOLFSSL_MDK5 Adds support for MDK5 ARM

2.4.11 OS Specific Defines

2.4.11.1 USE_WINDOWS_API Specify use of windows library APIs' as opposed to Unix/Linux APIs'

2.4.11.2 WIN32_LEAN_AND_MEAN Adds support for the Microsoft win32 lean and mean build.

2.4.11.3 FREERTOS_TCP Adds support for the FREERTOS TCP stack

2.4.11.4 WOLFSSL_SAFERTOS Adds support for SafeRTOS

2.5 Build Options

The following are options which may be appended to the `./configure` script to customize how the wolfSSL library is built.

By default, wolfSSL only builds in shared mode, with static mode being disabled. This speeds up build times by a factor of two. Either mode can be explicitly disabled or enabled if desired.

2.5.1 --enable-debug

Enable wolfSSL debugging support. Enabling debug support allows easier debugging by compiling with debug information and defining the constant `DEBUG_WOLFSSL` which outputs messages to `stderr`. To turn debug on at runtime, call `wolfSSL_Debugging_ON()`. To turn debug logging off at runtime, call `wolfSSL_Debugging_OFF()`. For more information, see [Debugging](#).

2.5.2 --enable-distro

Enable wolfSSL distro build.

2.5.3 --enable-singlethread

Enable single threaded mode, no multi thread protections.

Enabling single threaded mode turns off multi thread protection of the session cache. Only enable single threaded mode if you know your application is single threaded or your application is multithreaded and only one thread at a time will be accessing the library.

2.5.4 --enable-dtls

Enable wolfSSL DTLS support

Enabling DTLS support allows users of the library to also use the DTLS protocol in addition to TLS and SSL. For more information, see the [DTLS](#) section.

2.5.5 --disable-rng

Disable compiling and using RNG

2.5.6 --enable-sctp

Enable wolfSSL DTLS-SCTP support

2.5.7 --enable-openssh

Enable OpenSSH compatibility build

2.5.8 --enable-apachehttpd

Enable Apache httpd compatibility build

2.5.9 --enable-openvpn

Enable OpenVPN compatibility build

2.5.10 --enable-opensslextra

Enable extra OpenSSL API compatibility, increases the size

Enabling OpenSSL Extra includes a larger set of OpenSSL compatibility functions. The basic build will enable enough functions for most TLS/SSL needs, but if you're porting an application that uses 10s or 100s of OpenSSL calls, enabling this will allow better support. The wolfSSL OpenSSL compatibility layer is under active development, so if there is a function missing which you need, please contact us and we'll try to help. For more information about the OpenSSL Compatibility Layer, please see [OpenSSL Compatibility](#).

2.5.11 --enable-opensslall

Enable all OpenSSL API.

2.5.12 --enable-maxstrength

Enable Max Strength build, allows TLSv1.2-AEAD-PFS ciphers only

2.5.13 --disable-harden

Disable Hardened build, Enables Timing Resistance and Blinding

2.5.14 --enable-ipv6

Enable testing of IPv6, wolfSSL proper is IP neutral

Enabling IPV6 changes the test applications to use IPv6 instead of IPv4. wolfSSL proper is IP neutral, either version can be used, but currently the test applications are IP dependent.

2.5.15 --enable-bump

Enable SSL Bump build

2.5.16 --enable-leanpsk

Enable Lean PSK build.

Very small build using PSK, and eliminating many features from the library. Approximate build size for wolfSSL on an embedded system with this enabled is 21kB.

2.5.17 --enable-leantls

Implements a lean TLS 1.2 client only (no client auth), ECC256, AES128 and SHA256 w/o Shamir. Meant to be used by itself at the moment and not in conjunction with other build options.

Enabling produces a small footprint TLS client that supports TLS 1.2 client only (no client auth), ECC256, AES128 and SHA256 w/o Shamir. Meant to be used by itself at the moment and not in conjunction with other build options.

2.5.18 --enable-bigcache

Enable a big session cache.

Enabling the big session cache will increase the session cache from 33 sessions to 20,027 sessions. The default session cache size of 33 is adequate for TLS clients and embedded servers. The big session cache is suitable for servers that aren't under heavy load, basically allowing 200 new sessions per minute or so.

2.5.19 --enable-hugecache

Enable a huge session cache.

Enabling the huge session cache will increase the session cache size to 65,791 sessions. This option is for servers that are under heavy load, over 13,000 new sessions per minute are possible or over 200 new sessions per second.

2.5.20 --enable-smallcache

Enable small session cache.

Enabling the small session cache will cause wolfSSL to only store 6 sessions. This may be useful for embedded clients or systems where the default of nearly 3kB is too much RAM. This define uses less than 500 bytes of RAM.

2.5.21 --enable-savesession

Enable persistent session cache.

Enabling this option will allow an application to persist (save) and restore the wolfSSL session cache to/from memory buffers.

2.5.22 --enable-savecert

Enable persistent cert cache.

Enabling this option will allow an application to persist (save) and restore the wolfSSL certificate cache to/from memory buffers.

2.5.23 --enable-atomicuser

Enable Atomic User Record Layer.

Enabling this option will turn on User Atomic Record Layer Processing callbacks. This will allow the application to register its own MAC/encrypt and decrypt/verify callbacks.

2.5.24 --enable-pkcallbacks

Enable Public Key Callbacks

2.5.25 --enable-sniffer

Enable wolfSSL sniffer support.

Enabling sniffer (SSL inspection) support will allow the collection of SSL traffic packets as well as the ability to decrypt those packets with the correct key file.

Currently the sniffer supports the following RSA ciphers:

CBC ciphers:

- AES-CBC
- Camellia-CBC
- 3DES-CBC

Stream ciphers:

- RC4
- Rabbit
- HC-128

2.5.26 --enable-aesgcm

Enable AES-GCM support.

Enabling this option will turn on Public Key callbacks, allowing the application to register its own ECC sign/verify and RSA sign/verify and encrypt/decrypt callbacks.

2.5.27 --enable-aesccm

Enable AES-CCM support

Enabling AES-GCM will add these cipher suites to wolfSSL. wolfSSL offers four different implementations of AES-GCM balancing speed versus memory consumption. If available, wolfSSL will use 64-bit or 32-bit math. For embedded applications, there is a speedy 8-bit version that uses RAM-based lookup tables (8KB per session) which is speed comparable to the 64-bit version and a slower 8-bit version that doesn't take up any additional RAM. The --enable-aesgcm configure option may be modified with the options =word32, =table, or =small, i.e. --enable-aesgcm=table.

2.5.28 --disable-aescbc

Used to with --disable-aescbc to compile out AES-CBC

AES-GCM will enable Counter with CBC-MAC Mode with 8-byte authentication (CCM-8) for AES.

2.5.29 --enable-aescfb

Turns on AES-CFB mode support

2.5.30 --enable-aesctr

Enable wolfSSL AES-CTR support

Enabling AES-CTR will enable Counter mode.

2.5.31 --enable-aesni

Enable wolfSSL Intel AES-NI support

Enabling AES-NI support will allow AES instructions to be called directly from the chip when using an AES-NI supported chip. This provides speed increases for AES functions. See [Features](#) for more details regarding AES-NI.

2.5.32 --enable-intelasm

Enable ASM speedups for Intel and AMD processors.

Enabling the intelasm option for wolfSSL will utilize expanded capabilities of your processor that dramatically enhance AES performance. The instruction sets leveraged when configure option is enabled include AVX1, AVX2, BMI2, RDRAND, RDSEED, AESNI, and ADX. These were first introduced into Intel processors and AMD processors have started adopting them in recent years. When enabled, wolfSSL will check the processor and take advantage of the instruction sets your processor supports.

2.5.33 --enable-camellia

Enable Camellia support

2.5.34 --enable-md2

Enable MD2 support

2.5.35 --enable-nullcipher

Enable wolfSSL NULL cipher support (no encryption)

2.5.36 --enable-ripemd

Enable wolfSSL RIPEMD-160 support

2.5.37 --enable-blake2

Enable wolfSSL BLAKE2 support

2.5.38 --enable-blake2s

Enable wolfSSL BLAKE2s support

2.5.39 --enable-sha3

Enabled by default on x86_64 and Aarch64.

Enables wolfSSL SHA3 support (=small for small build)

2.5.40 --enable-sha512

Enabled by default on x86_64.

Enable wolfSSL SHA-512 support

2.5.41 --enable-sessioncerts

Enable session cert storing

2.5.42 --enable-keygen

Enable key generation

2.5.43 --enable-certgen

Enable cert generation

2.5.44 --enable-certreq

Enable cert request generation

2.5.45 --enable-sep

Enable SEP extensions

2.5.46 --enable-hkdf

Enable HKDF (HMAC-KDF)

2.5.47 --enable-x963kdf

Enable X9.63 KDF support

2.5.48 --enable-dsa

Enable Digital Signature Algorithm (DSA).

NIST approved digital signature algorithm along with RSA and ECDSA as defined by FIPS 186-4 and are used to generate and verify digital signatures if used in conjunction with an approved hash function as defined by the Secure Hash Standard (FIPS 180-4).

2.5.49 --enable-eccshamir

Enabled by default on x86_64

Enable ECC Shamir

2.5.50 --enable-ecc

Enabled by default on x86_64

Enable ECC.

Enabling this option will build ECC support and cipher suites into wolfSSL.

2.5.51 --enable-eccustcurves

Enable ECC custom curves (=all to enable all curve types)

2.5.52 --enable-compkey

Enable compressed keys support

2.5.53 --enable-curve25519

Enable Curve25519 (or --enable-curve25519=small for CURVE25519_SMALL).

An elliptic curve offering 128 bits of security and to be used with ECDH key agreement (see [Cross Compiling](#)). Enabling curve25519 option allows for the use of the curve25519 algorithm. The default curve25519 is set to use more memory but have a faster run time. To have the algorithm use less memory the option --enable-curve25519=small can be used. Although using less memory there is a trade off in speed.

2.5.54 --enable-ed25519

Enable ED25519 (or --enable-ed25519=small for ED25519_SMALL)

Enabling ed25519 option allows for the use of the ed25519 algorithm. The default ed25519 is set to use more memory but have a faster run time. To have the algorithm use less memory the option --enable-ed25519=small can be used. Like with curve25519 using this enable option less is a trade off between speed and memory.

2.5.55 --enable-fpcc

Enable Fixed Point cache ECC

2.5.56 --enable-eccencrypt

Enable ECC encrypt

2.5.57 --enable-psk

Enable PSK (Pre Shared Keys)

2.5.58 --disable-errorstrings

Disable the error strings table

2.5.59 --disable-oldtls

Disable old TLS version < 1.2

2.5.60 --enable-ssl3

Enable SSL version 3.0

2.5.61 --enable-stacksize

Enable stack size info on examples

2.5.62 --disable-memory

Disable memory callbacks

2.5.63 --disable-rsa

Disable RSA

2.5.64 --enable-rsapss

Enable RSA-PSS

2.5.65 --disable-dh

Disable DH

2.5.66 --enable-anon

Enable Anonymous

2.5.67 --disable-asn

Disable ASN

2.5.68 --disable-aes

Disable AES

2.5.69 --disable-coding

Disable Coding base 16/64

2.5.70 --enable-base64encode

Enabled by default on x86_64

Enable Base64 encoding

2.5.71 --disable-des3

Disable DES3

2.5.72 --enable-idea

Enable IDEA Cipher

2.5.73 --enable-arc4

Enable ARC4

2.5.74 --disable-md5

Disable MD5

2.5.75 --disable-sha

Disable SHA

2.5.76 --enable-webserver

Enable Web Server.

This turns on functions required over the standard build that will allow full functionality for building with the yaSSL Embedded Web Server.

2.5.77 --enable-hc128

Enable streaming cipher HC-128

2.5.78 --enable-rabbit

Enable streaming cipher RABBIT

2.5.79 --enable-fips

Enable FIPS 140-2 (Must have license to implement.)

2.5.80 --enable-sha224

Enabled by default on x86_64

Enable wolfSSL SHA-224 support

2.5.81 --disable-poly1305

Disable wolfSSL POLY1305 support

2.5.82 --disable-chacha

Disable CHACHA

2.5.83 --disable-hashdrbg

Disable Hash DRBG support

2.5.84 --disable-filesystem

Disable Filesystem support.

This makes it easier to disable filesystem use. This option defines `NO_FILESYSTEM`.

2.5.85 --disable-inline

Disable inline functions.

Disabling this option disables function inlining in wolfSSL. Function placeholders that are not linked against but, rather, the code block is inserted into the function call when function inlining is enabled.

2.5.86 --enable-ocsp

Enable Online Certificate Status Protocol (OCSP).

Enabling this option adds OCSP (Online Certificate Status Protocol) support to wolfSSL. It is used to obtain the revocation status of x.509 certificates as described in RFC 6960.

2.5.87 --enable-ocspstapling

Enable OCSP Stapling

2.5.88 --enable-ocspstapling2

Enable OCSP Stapling version 2

2.5.89 --enable-crl

Enable CRL (Certificate Revocation List)

2.5.90 --enable-crl-monitor

Enable CRL Monitor.

Enabling this option adds the ability to have wolfSSL actively monitor a specific CRL (Certificate Revocation List) directory.

2.5.91 --enable-sni

Enable Server Name Indication (SNI).

Enabling this option will turn on the TLS Server Name Indication (SNI) extension.

2.5.92 --enable-maxfragment

Enable Maximum Fragment Length.

Enabling this option will turn on the TLS Maximum Fragment Length extension.

2.5.93 --enable-alpn

Enable Application Layer Protocol Negotiation (ALPN)

2.5.94 --enable-truncatedhmac

Enable Truncated Keyed-hash MAC (HMAC).

Enabling this option will turn on the TLS Truncated HMAC extension.

2.5.95 --enable-renegotiation-indication

Enable Renegotiation Indication.

As described in [RFC 5746](#), this specification prevents an SSL/TLS attack involving renegotiation splicing by tying the renegotiations to the TLS connection they are performed over.

2.5.96 --enable-secure-renegotiation

Enable Secure Renegotiation

2.5.97 --enable-supportedcurves

Enable Supported Elliptic Curves.

Enabling this option will turn on the TLS Supported ECC Curves extension.

2.5.98 --enable-session-ticket

Enable Session Ticket

2.5.99 --enable-extended-master

Enable Extended Master Secret

2.5.100 --enable-tlsx

Enable all TLS extensions.

Enabling this option will turn on all TLS extensions currently supported by wolfSSL.

2.5.101 --enable-pkcs7

Enable PKCS#7 support

2.5.102 --enable-pkcs11

Enable PKCS#11 access

2.5.103 --enable-ssh

Enable wolfSSH options

2.5.104 --enable-scep

Enable wolfSCEP (Simple Certificate Enrollment Protocol)

As defined by the Internet Engineering Task Force, Simple Certificate Enrollment Protocol is a PKI that leverages PKCS#7 and PKCS#10 over HTTP. CERT notes that SCEP does not strongly authenticate certificate requests.

2.5.105 --enable-srp

Enable Secure Remote Password

2.5.106 --enable-smallstack

Enable Small Stack Usage

2.5.107 --enable-valgrind

Enable valgrind for unit tests.

Enabling this option will turn on valgrind when running the wolfSSL unit tests. This can be useful for catching problems early on in the development cycle.

2.5.108 --enable-testcert

Enable Test Cert.

When this option is enabled, it exposes part of the ASN certificate API that is usually not exposed. This can be useful for testing purposes, as seen in the wolfCrypt test application (wolfcrypt/test/test.c).

2.5.109 --enable-iopool

Enable I/O Pool example

2.5.110 --enable-certservice

Enable certificate service (Windows Servers)

2.5.111 --enable-jni

Enable wolfSSL JNI

2.5.112 --enable-lighty

Enable lighttpd/lighty

2.5.113 --enable-stunnel

Enable stunnel

2.5.114 --enable-md4

Enable MD4

2.5.115 --enable-pwdbased

Enable PWDBASED

2.5.116 --enable-scrypt

Enable SCRYPT

2.5.117 --enable-cryptonly

Enable wolfCrypt Only build

2.5.118 --enable-fastmath

Enabled by default on x86_64

Enable fast math ops.

Enabling fastmath will speed up public key operations like RSA, DH, and DSA. By default, wolfSSL uses the normal big integer math library. This is generally the most portable and generally easiest to get going with. The negatives to the normal big integer library are that it is slower and it uses a lot of dynamic memory. This option switches the big integer library to a faster one that uses assembly if possible. Assembly inclusion is dependent on compiler and processor combinations. Some combinations will need additional configure flags and some may not be possible. Help with optimizing fastmath with new assembly routines is available on a consulting basis.

On ia32, for example, all of the registers need to be available so high optimization and omitting the frame pointer needs to be taken care of. wolfSSL will add `-O3 -fomit-frame-pointer` to GCC for non debug builds. If you're using a different compiler you may need to add these manually to CFLAGS during configure.

OS X will also need `-mdynamic-no-pic` added to CFLAGS. In addition, if you're building in shared mode for ia32 on OS X you'll need to pass options to LDFLAGS as well:

```
LDFLAGS="-Wl,-read_only_relocs,warning"
```

This gives warning for some symbols instead of errors.

fastmath also changes the way dynamic and stack memory is used. The normal math library uses dynamic memory for big integers. Fastmath uses fixed size buffers that hold 4096 bit integers by default, allowing for 2048 bit by 2048 bit multiplications. If you need 4096 bit by 4096 bit multiplications then change `FP_MAX_BITS` in `wolfssl/wolfcrypt/tfm.h`. As `FP_MAX_BITS` is increased, this will also increase the runtime stack usage since the buffers used in the public key operations will now be larger. A couple of functions in the library use several temporary big integers, meaning the stack can get relatively large. This should only come into play on embedded systems or in threaded environments where the stack size is set to a low value. If stack corruption occurs with fastmath during public key operations in those environments, increase the stack size to accommodate the stack usage.

If you are enabling fastmath without using the autoconf system, you'll need to define `USE_FAST_MATH` and add `tfm.c` to the wolfSSL build instead of `integer.c`.

Since the stack memory can be large when using fastmath, we recommend defining `TFM_TIMING_RESISTANT` when using the fastmath library. This will get rid of large static arrays.

2.5.119 --enable-fasthugemath

Enable fast math + huge code

Enabling fasthugemath includes support for the fastmath library and greatly increases the code size by unrolling loops for popular key sizes during public key operations. Try using the benchmark utility before and after using fasthugemath to see if the slight speedup is worth the increased code size.

2.5.120 --disable-examples

Disable building examples.

When enabled, the wolfSSL example applications will be built (`client`, `server`, `echoclient`, `echoserver`).

2.5.121 --disable-crypttests

Disable Crypt Bench/Test

2.5.122 --enable-fast-rsa

Enable RSA using Intel IPP.

Enabling fast-rsa speeds up RSA operations by using IPP libraries. It has a larger memory consumption than the default RSA set by wolfSSL. If IPP libraries can not be found an error message will be displayed during configuration. The first location that autoconf will look is in the directory `wolfssl_root/IPP` the second is standard location for libraries on the machine such as `/usr/lib/` on linux systems.

The libraries used for RSA operations are in the directory `wolfssl-X.X.X/IPP/` where X.X.X is the current wolfSSL version number. Building from the bundled libraries is dependent on the directory location and name of IPP so the file structure of the subdirectory IPP should not be changed.

When allocating memory the fast-rsa operations have a memory tag of `DYNAMIC_TYPE_USER_CRYPT0`. This allows for viewing the memory consumption of RSA operations during run time with the fast-rsa option.

2.5.123 --enable-staticmemory

Enable static memory use

2.5.124 --enable-mcapi

Enable Microchip API

2.5.125 --enable-asynccrypt

Enable Asynchronous Crypto

2.5.126 --enable-sessionexport

Enable export and import of sessions

2.5.127 --enable-aeskeywrap

Enable AES key wrap support

2.5.128 --enable-jobserver

Values: yes (default) / no / #

When using make this builds wolfSSL using a multithreaded build, yes (default) detects the number of CPU cores and builds using a recommended amount of jobs for that count, # to specify an exact number. This works in a similar way to the make -j option.

2.5.129 --enable-shared[=PKGS]

Building shared wolfSSL libraries [default=yes]

Disabling the shared library build will exclude a wolfSSL shared library from being built. By default only a shared library is built in order to save time and space.

2.5.130 --enable-static[=PKGS]

Building static wolfSSL libraries [default=no]

2.5.131 --with-ntru=PATH

Path to NTRU install (default /usr/).

This turns on the ability for wolfSSL to use NTRU cipher suites. NTRU is now available under the GPLv2 from Security Innovation. The NTRU bundle may be downloaded from the Security Innovation GitHub repository available at <https://github.com/NTRUOpenSourceProject/ntru-crypto>.

2.5.132 --with-libz=PATH

Optionally include libz for compression.

Enabling libz will allow compression support in wolfSSL from the libz library. Think twice about including this option and using it by calling `wolfSSL_set_compression()`. While compressing data before sending decreases the actual size of the messages being sent and received, the amount of data saved by compression usually takes longer in time to analyze than it does to send it raw on all but the slowest of networks.

2.5.133 --with-cavium

Path to cavium/software directory.

2.5.134 --with-user-crypto

Path to USER_CRYPT0 install (default /usr/local).

2.5.135 --enable-rsavy

Enables RSA verify only support (**note** requires `--enable-cryptonly`)

2.5.136 --enable-rsapub

Default value: Enabled RSA public key only support (**note** requires `--enable-cryptonly`)

2.5.137 --enable-sp

Enable single-precision math for RSA, DH, and ECC to improve performance.

2.5.138 --enable-sp-asm

Enable single-precision assembly implementation.

Can be used to enable single-precision performance improvements through assembly with ARM and 64-bit ARM architectures.

2.5.139 --enable-armasm

Enables ARMv8 ASM support.

The default configure sets mcpu or mfpv based on 64 vs 32 bit system. It does not overwrite mcpu or mfpv setting passed in by use of CPPFLAGS. On some compilers -mstrict-align may be needed due to the constraints and -mstrict-align is now also set by default unless a user passes in mcpu/mfpv flags with CPPFLAGS.

2.5.140 --disable-tlsv12

Disable TLS 1.2 support

2.5.141 --enable-tls13

Enable TLS 1.3 support

This build option can be combined with `--disable-tlsv12` and `--disable-oldtls` to produce a wolfSSL build that is only TLS 1.3.

2.5.142 --enable-all

Enables all wolfSSL features, excluding SSL v3

2.5.143 --enable-xts

Enables AES-XTS mode

2.5.144 --enable-asio

Enables ASIO.

Requires that the options `--enable-opensslextra` and `--enable-opensslall` be enabled when configuring wolfSSL. If these two options are not enabled, then the autoconf tool will automatically enable these options to enable ASIO when configuring wolfSSL.

2.5.145 --enable-qt

Enables Qt 5.12 onwards support.

Enables wolfSSL build settings compatible with the wolfSSL Qt port. Patch file is required from wolfSSL for patching Qt source files.

2.5.146 --enable-qt-test

Enable Qt test compatibility build.

Enables support for building wolfSSL for compatibility with running the built-in Qt tests.

2.5.147 --enable-apache-httpd

Enables Apache httpd support

2.5.148 --enable-afalg

Enables use of Linux module AF_ALG for hardware acceleration. Additional Xilinx use with `=xilinx`, `=xilinx-rsa`, `=xilinx-aes`, `=xilinx-sha3`

Is similar to `--enable-devcrypto` in that it leverages a Linux kernel module (AF_ALG) for offloading crypto operations. On some hardware the module has performance accelerations available through the Linux crypto drivers. In the case of Petalinux with Xilinx the flag `--enable-afalg=xilinx` can be used to tell wolfSSL to use the Xilinx interface for AF_ALG.

2.5.149 --enable-devcrypto

Enables use of Linux `/dev/crypto` for hardware acceleration.

Has the ability to receive arguments, being able to receive any combination of aes (all aes support), hash (all hash algorithms), and cbc (aes-cbc only). If no options are given, it will default to using all.

2.5.150 --enable-mcast

Enable wolfSSL DTLS multicast support

2.5.151 --disable-pkcs12

Disable PKCS12 code

2.5.152 --enable-fallback-scsv

Enables Signaling Cipher Suite Value(SCSV)

2.5.153 --enable-psk-one-id

Enables support for single PSK ID with TLS 1.3

2.6 Cross Compiling

Many users on embedded platforms cross compile wolfSSL for their environment. The easiest way to cross compile the library is to use the `./configure` system. It will generate a Makefile which can then be used to build wolfSSL.

When cross compiling, you'll need to specify the host to `./configure`, such as:

```
./configure --host=arm-linux
```

You may also need to specify the compiler, linker, etc. that you want to use:

```
./configure --host=arm-linux CC=arm-linux-gcc AR=arm-linux-ar RANLIB=arm-linux
```

There is a bug in the configure system which you might see when cross compiling and detecting user overriding malloc. If you get an undefined reference to `rpl_malloc` and/or `rpl_realloc`, please add the following to your `./configure` line:

```
ac_cv_func_malloc_0_nonnull=yes ac_cv_func_realloc_0_nonnull=yes
```

After correctly configuring wolfSSL for cross-compilation, you should be able to follow standard auto-conf practices for building and installing the library:

```
make
sudo make install
```

If you have any additional tips or feedback about cross compiling wolfSSL, please let us know at info@wolfssl.com.

2.6.1 Example cross compile configure options for toolchain builds

2.6.1.1 armebv7-eabi-hf-glibc

```
./configure --host=armeb-linux \
    CC=armeb-linux-gcc LD=armeb-linux-ld \
    AR=armeb-linux-ar \
    RANLIB=armeb-linux-ranlib \
    CFLAGS="-DWOLFSSL_USER_IO -Os" \
    CPPFLAGS="-I./"
```

2.6.1.2 armv5-eabi-glibc

```
./configure --host=arm-linux \
    CC=arm-linux-gcc LD=arm-linux-ld \
    AR=arm-linux-ar \
    RANLIB=arm-linux-ranlib \
    CFLAGS="-DWOLFSSL_USER_IO -Os" \
    CPPFLAGS="-I./"
```

2.6.1.3 armv6-eabi-hf-glibc

```
./configure --host=arm-linux \
    CC=arm-linux-gcc LD=arm-linux-ld \
    AR=arm-linux-ar \
    RANLIB=arm-linux-ranlib \
```

```
CFLAGS="-DWOLFSSL_USER_IO -Os" \  
CPPFLAGS="-I./"
```

2.6.1.4 armv7-eabi-hf-glibc

```
./configure --host=arm-linux \  
CC=arm-linux-gcc LD=arm-linux-ld \  
AR=arm-linux-ar \  
RANLIB=arm-linux-ranlib \  
CFLAGS="-DWOLFSSL_USER_IO -Os" \  
CPPFLAGS="-I./"
```

2.6.1.5 armv7m-uclibc

```
./configure --enable-static --disable-shared --host=arm-linux CC=arm-linux-gcc \  
LD=arm-linux-ld AR=arm-linux-ar \  
RANLIB=arm-linux-ranlib \  
CFLAGS="-DWOLFSSL_USER_IO -Os" \  
CPPFLAGS="-I./"
```

2.6.1.6 arm-none-eabi-gcc

```
./configure --host=arm-none-eabi \  
CC=arm-none-eabi-gcc LD=arm-none-eabi-ld \  
AR=arm-none-eabi-ar RANLIB=arm-none-eabi-ranlib \  
CFLAGS="-DNO_WOLFSSL_DIR \  
-DWOLFSSL_USER_IO -DNO_WRITEV \  
-mcpu=cortex-m4 -mthumb -Os \  
-specs=rdimon.specs" CPPFLAGS="-I./"
```

2.6.1.7 mips32-glibc

```
./configure --host=mips-linux \  
CC=mips-linux-gcc LD=mips-linux-ld \  
AR=mips-linux-ar \  
RANLIB=mips-linux-ranlib \  
CFLAGS="-DWOLFSSL_USER_IO -Os" \  
CPPFLAGS="-I./"
```

2.6.1.8 PowerPc64le-Power8-Glibc

```
./configure --host=powerpc64le-buildroot-linux-gnu \  
CC=powerpc64le-buildroot-linux-gnu-gcc \  
LD=powerpc64le-buildroot-linux-gnu-ld \  
AR=powerpc64le-buildroot-linux-gnu-ar \  
RANLIB=powerpc64le-buildroot-linux-gnu-ranlib \  
CFLAGS="-DWOLFSSL_USER_IO -Os" \  
CPPFLAGS="-I./"
```

2.6.1.9 x86-64-core-i7-glibc

```
./configure --host=x86_64-linux \  
CC=x86_64-linux-gcc LD=x86_64-linux-ld \  
AR=x86_64-linux-ar
```

```
RANLIB=x86_64-linux-ranlib \
CFLAGS="-DWOLFSSL_USER_IO -Os" \
CPPFLAGS="-I./"
```

2.6.1.10 x86-64-core-i7-musl

```
./configure --host=x86_64-linux \
CC=x86_64-linux-gcc LD=x86_64-linux-ld \
AR=x86_64-linux-ar \
RANLIB=x86_64-linux-ranlib \
CFLAGS="-DWOLFSSL_USER_IO -Os" \CPPFLAGS="-I./"
```

2.6.1.11 x86-64-core-i7-uclibc

```
./configure --host=x86_64-linux \
CC=x86_64-linux-gcc LD=x86_64-linux-ld \
AR=x86_64-linux-ar \
RANLIB=x86_64-linux-ranlib \
CFLAGS="-DWOLFSSL_USER_IO -Os" \
CPPFLAGS="-I./"
```

2.7 2.7 Building Ports

wolfSSL has been ported to many environments and devices. A portion of these ports and accompanying documentation for them is located in the directory `wolfssl-X.X.X/IDE`, where X.X.X is the current wolfSSL version number. This directory also contains helpful information and code for IDE's used to build wolfSSL for the environments.

PORT Lists:

- Arduino
- LPCXPRESSO
- Wiced Studio
- CSBench
- SGX Windows and Linux
 - These directories (`wolfssl/IDE/WIN-SGX` and `wolfssl/IDE/LINUX-SGX`) contain Makefiles for and Visual Studio solutions for building wolfSSL as a library to be used in an Intel SGX project.
- Hexagon
 - This directory (`wolfssl/IDE/HEXAGON`) contains a Makefile for building with the Hexagon tool chain. It can be used to build wolfSSL for offloading ECC verify operations to a DSP processor. The directory contains a README file to help with the steps required to build.
- Hexiwear
- NetBurner M68K
 - In the directory (`wolfssl/IDE/M68K`) there is a Makefile for building wolfSSL for a MCF5441X device using the Netburner RTOS.
- Renesas
 - This directory (`wolfssl/IDE/Renesas`) contains multiple builds for different Renesas devices. It also has example builds that demonstrate using hardware acceleration.
- XCode
- Eclipse
- Espressif
- IAR-EWARM
- Kinetis Design Studio (KDS)
- Rowley Crossworks ARM

- OpenSTM32
- RISC-V
- Zephyr
- Mynewt
- INTIME-RTOS

3 Getting Started

3.1 General Description

wolfSSL, formerly CyaSSL, is about 10 times smaller than yaSSL and up to 20 times smaller than OpenSSL when using the compile options described in [Chapter 2](#). User benchmarking and feedback also reports dramatically better performance from wolfSSL vs. OpenSSL in the vast majority of standard SSL operations.

For instructions on the build process please see [Chapter 2](#).

3.2 Testsuite

The testsuite program is designed to test the ability of wolfSSL and its cryptography library, wolfCrypt, to run on the system.

wolfSSL needs all examples and tests to be run from the wolfSSL home directory. This is because it finds certs and keys from ./certs. To run testsuite, execute:

```
./testsuite/testsuite.test
```

Or when using autoconf:

```
make test
```

On *nix or Windows the examples and testsuite will check to see if the current directory is the source directory and if so, attempt to change to the wolfSSL home directory. This should work in most setup cases, if not, just use the first method above and specify the full path.

On a successful run you should see output like this, with additional output for unit tests and cipher suite tests:

```
-----
wolfSSL version 4.8.1
-----
error      test passed!
MEMORY     test passed!

gNQWZL

```

All tests passed!

This indicates that everything is configured and built correctly. If any of the tests fail, make sure the build system was set up correctly. Likely culprits include having the wrong endianness or not properly setting the 64-bit type. If you've set anything to the non-default settings try removing those, rebuilding wolfSSL, and then re-testing.

3.3 Client Example

You can use the client example found in `examples/client` to test wolfSSL against any SSL server. To see a list of available command line runtime options, run the client with the `--help` argument:

```
./examples/client/client --help
```

Which returns:

```

wolfSSL client 4.8.1 NOTE: All files relative to wolfSSL home dir
Max RSA key size in bits for build is set at : 4096
-? <num>      Help, print this usage
              0: English, 1: Japanese
--help        Help, in English
-h <host>     Host to connect to, default 127.0.0.1
-p <num>      Port to connect on, not 0, default 11111
-v <num>      SSL version [0-4], SSLv3(0) - TLS1.3(4), default 3
-V           Prints valid ssl version numbers, SSLv3(0) - TLS1.3(4)
-l <str>      Cipher suite list (: delimited)
-c <file>     Certificate file, default ./certs/client-cert.pem
-k <file>     Key file, default ./certs/client-key.pem
-A <file>     Certificate Authority file, default ./certs/ca-cert.pem
-Z <num>      Minimum DH key bits, default 1024
-b <num>      Benchmark <num> connections and print stats
-B <num>      Benchmark throughput using <num> bytes and print stats
-d           Disable peer checks
-D           Override Date Errors example
-e           List Every cipher suite available,
-g           Send server HTTP GET
-u           Use UDP DTLS, add -v 2 for DTLSv1, -v 3 for DTLSv1.2 (default)
-m           Match domain name in cert
-N           Use Non-blocking sockets
-r           Resume session
-w           Wait for bidirectional shutdown
-M <prot>     Use STARTTLS, using <prot> protocol (smtp)
-f           Fewer packets/group messages
-x           Disable client cert/key loading

```

```

-X          Driven by eXternal test case
-j          Use verify callback override
-n          Disable Extended Master Secret
-H <arg>    Internal tests [defCipherList, exitWithRet, verifyFail, useSupCurve,
                    loadSSL, disallowETM]
-J          Use HelloRetryRequest to choose group for KE
-K          Key Exchange for PSK not using (EC)DHE
-I          Update keys and IVs before sending data
-y          Key Share with FFDHE named groups only
-Y          Key Share with ECC named groups only
-1 <num>    Display a result by specified language.
            0: English, 1: Japanese
-2          Disable DH Prime check
-6          Simulate WANT_WRITE errors on every other IO send
-7          Set minimum downgrade protocol version [0-4]  SSLv3(0) - TLS1.3(4)

```

To test against example.com:443 try the following. This is using wolfSSL compiled with the --enable-opensslextra and --enable-supportedcurves build options:

```
./examples/client/client -h example.com -p 443 -d -g
```

Which returns:

Alternate cert chain used

issuer : /C=US/O=DigiCert Inc/CN=DigiCert TLS RSA SHA256 2020 CA1

subject: /C=US/ST=California/L=Los Angeles/O=Internet Corporation for Assigned Names and Numbers

altname = www.example.net

altname = www.example.edu

altname = www.example.com

altname = example.org

altname = example.net

altname = example.edu

altname = example.com

altname = www.example.org

serial number:0f:be:08:b0:85:4d:05:73:8a:b0:cc:e1:c9:af:ee:c9

SSL version is TLSv1.2

SSL cipher suite is TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256

SSL curve name is SECP256R1

Session timeout set to 500 seconds

Client Random : 20640B8131D8E542646D395B362354F9308057B1624C2442C0B5FCDD064BFE29

SSL connect ok, sending GET...

HTTP/1.0 200 OK

Accept-Ranges: bytes

Content-Type: text/html

Date: Thu, 14 Oct 2021 16:50:28 GMT

Last-Modified: Thu, 14 Oct 2021 16:45:10 GMT

Server: ECS (nyb/1D10)

Content-Length: 94

Connection: close

This tells the client to connect to (-h) example.com on the HTTPS port (-p) of 443 and sends a generic (-g) GET request. The (-d) option tells the client not to verify the server. The rest is the initial output from the server that fits into the read buffer.

If no command line arguments are given, then the client attempts to connect to the localhost on the wolfSSL default port of 11111. It also loads the client certificate in case the server wants to perform client authentication.

The client is able to benchmark a connection when using the `-b <num>` argument. When used, the client attempts to connect to the specified server/port the argument number of times and gives the average time in milliseconds that it took to perform `SSL_connect()`. For example:

```
/examples/client/client -b 100 -h example.com -p 443 -d
```

Returns:

```
wolfSSL_connect avg took: 296.417 milliseconds
```

If you'd like to change the default host from localhost, or the default port from 11111, you can change these settings in `/wolfssl/test.h`. The variables `wolfSSLIP` and `wolfSSLPort` control these settings. Re-build all of the examples including testsuite when changing these settings otherwise the test programs won't be able to connect to each other.

By default, the wolfSSL example client tries to connect to the specified server using TLS 1.2. The user is able to change the SSL/TLS version which the client uses by using the `-v` command line option. The following values are available for this option:

- `-v 0` - SSL 3.0 (disabled by default)
- `-v 1` - TLS 1.0
- `-v 2` - TLS 1.1
- `-v 3` - TLS 1.2 (selected by default)
- `-v 4` - TLS 1.3

A common error users see when using the example client is -188:

```
wolfSSL_connect error -188, ASN no signer error to confirm failure
wolfSSL error: wolfSSL_connect failed
```

This is typically caused by the wolfSSL client not being able to verify the certificate of the server it is connecting to. By default, the wolfSSL client loads the yaSSL test CA certificate as a trusted root certificate. This test CA certificate will not be able to verify an external server certificate which was signed by a different CA. As such, to solve this problem, users either need to turn off verification of the peer (server), using the `-d` option:

```
./examples/client/client -h myhost.com -p 443 -d
```

Or load the correct CA certificate into the wolfSSL client using the `-A` command line option:

```
./examples/client/client -h myhost.com -p 443 -A serverCA.pem
```

3.4 Server Example

The server example demonstrates a simple SSL server that optionally performs client authentication. Only one client connection is accepted and then the server quits. The client example in normal mode (no command line arguments) will work just fine against the example server, but if you specify command line arguments for the client example, then a client certificate isn't loaded and the `wolfSSL_connect()` will fail (unless client cert check is disabled using the `-d` option). The server will report an error "-245, peer didn't send cert". Like the example client, the server can be used with several command line arguments as well:

```
./examples/server/server --help
```

Which returns:

```
server 4.8.1 NOTE: All files relative to wolfSSL home dir
-? <num>      Help, print this usage
              0: English, 1: Japanese
--help       Help, in English
-p <num>      Port to listen on, not 0, default 11111
```

```

-v <num>      SSL version [0-4], SSLv3(0) - TLS1.3(4)), default 3
-l <str>      Cipher suite list (: delimited)
-c <file>     Certificate file, default ./certs/server-cert.pem
-k <file>     Key file, default ./certs/server-key.pem
-A <file>     Certificate Authority file, default ./certs/client-cert.pem
-R <file>     Create Ready file for external monitor default none
-D <file>     Diffie-Hellman Params file, default ./certs/dh2048.pem
-Z <num>     Minimum DH key bits, default 1024
-d           Disable client cert check
-b           Bind to any interface instead of localhost only
-s           Use pre Shared keys
-u           Use UDP DTLS, add -v 2 for DTLSv1, -v 3 for DTLSv1.2 (default)
-f           Fewer packets/group messages
-r           Allow one client Resumption
-N           Use Non-blocking sockets
-S <str>     Use Host Name Indication
-w           Wait for bidirectional shutdown
-x           Print server errors but do not close connection
-i           Loop indefinitely (allow repeated connections)
-e           Echo data mode (return raw bytes received)
-B <num>     Benchmark throughput using <num> bytes and print stats
-g           Return basic HTML web page
-C <num>     The number of connections to accept, default: 1
-H <arg>     Internal tests [defCipherList, exitWithRet, verifyFail, useSupCurve,
              loadSSL, disallowETM]
-U           Update keys and IVs before sending
-K           Key Exchange for PSK not using (EC)DHE
-y           Pre-generate Key Share using FFDHE_2048 only
-Y           Pre-generate Key Share using P-256 only
-F           Send alert if no mutual authentication
-2           Disable DH Prime check
-1 <num>     Display a result by specified language.
              0: English, 1: Japanese
-6           Simulate WANT_WRITE errors on every other IO send
-7           Set minimum downgrade protocol version [0-4] SSLv3(0) - TLS1.3(4)

```

3.5 EchoServer Example

The echoserver example sits in an endless loop waiting for an unlimited number of client connections. Whatever the client sends the echoserver echoes back. Client authentication isn't performed so the example client can be used against the echoserver in all 3 modes. Four special commands aren't echoed back and instruct the echoserver to take a different action.

1. **quit** - If the echoserver receives the string "quit" it will shutdown.
2. **break** If the echoserver receives the string "break" it will stop the current session but continue handling requests. This is particularly useful for DTLS testing.
3. **printstats** - If the echoserver receives the string "printstats" it will print out statistics for the session cache.
4. **GET** - If the echoserver receives the string "GET" it will handle it as an http get and send back a simple page with the message "greeting from wolfSSL". This allows testing of various TLS/SSL clients like Safari, IE, Firefox, gnutls, and the like against the echoserver example.

The output of the echoserver is echoed to stdout unless NO_MAIN_DRIVER is defined. You can redirect output through the shell or through the first command line argument. To create a file named output.txt with the output from the echoserver run:

```
./examples/echoserver/echoserver output.txt
```

3.6 EchoClient Example

The echoclient example can be run in interactive mode or batch mode with files. To run in interactive mode and write 3 strings "hello", "wolfssl", and "quit" results in:

```
./examples/echoclient/echoclient
hello
hello
wolfssl
wolfssl
quit
sending server shutdown command: quit!
```

To use an input file, specify the filename on the command line as the first argument. To echo the contents of the file input.txt issue:

```
./examples/echoclient/echoclient input.txt
```

If you want the result to be written out to a file, you can specify the output file name as an additional command line argument. The following command will echo the contents of file input.txt and write the result from the server to output.txt:

```
./examples/echoclient/echoclient input.txt output.txt
```

The testsuite program does just that, but hashes the input and output files to make sure that the client and server were getting/sending the correct and expected results.

3.7 Benchmark

Many users are curious about how the wolfSSL embedded SSL library will perform on a specific hardware device or in a specific environment. Because of the wide variety of different platforms and compilers used today in embedded, enterprise, and cloud-based environments, it is hard to give generic performance calculations across the board.

To help wolfSSL users and customers in determining SSL performance for wolfSSL / wolfCrypt, a benchmark application is provided which is bundled with wolfSSL. wolfSSL uses the wolfCrypt cryptography library for all crypto operations by default. Because the underlying crypto is a very performance-critical aspect of SSL/TLS, our benchmark application runs performance tests on wolfCrypt's algorithms.

The benchmark utility located in wolfcrypt/benchmark (./wolfcrypt/benchmark/benchmark) may be used to benchmark the cryptographic functionality of wolfCrypt. Typical output may look like the following (in this output, several optional algorithms/ciphers were enabled including HC-128, RABBIT, ECC, SHA-256, SHA-512, AES-GCM, AES-CCM, and Camellia):

```
./wolfcrypt/benchmark/benchmark
```

```
-----
wolfSSL version 4.8.1
-----
```

```
wolfCrypt Benchmark (block bytes 1048576, min 1.0 sec each)
```

```
RNG                105 MB took 1.004 seconds, 104.576 MB/s Cycles per byte = 20.94
AES-128-CBC-enc    310 MB took 1.008 seconds, 307.434 MB/s Cycles per byte = 7.12
AES-128-CBC-dec    290 MB took 1.002 seconds, 289.461 MB/s Cycles per byte = 7.56
AES-192-CBC-enc    265 MB took 1.010 seconds, 262.272 MB/s Cycles per byte = 8.35
AES-192-CBC-dec    240 MB took 1.013 seconds, 236.844 MB/s Cycles per byte = 9.24
AES-256-CBC-enc    240 MB took 1.011 seconds, 237.340 MB/s Cycles per byte = 9.22
AES-256-CBC-dec    235 MB took 1.018 seconds, 230.864 MB/s Cycles per byte = 9.48
```

```

AES-128-GCM-enc 160 MB took 1.011 seconds, 158.253 MB/s Cycles per byte = 13.83
AES-128-GCM-dec 160 MB took 1.016 seconds, 157.508 MB/s Cycles per byte = 13.90
AES-192-GCM-enc 150 MB took 1.022 seconds, 146.815 MB/s Cycles per byte = 14.91
AES-192-GCM-dec 150 MB took 1.039 seconds, 144.419 MB/s Cycles per byte = 15.16
AES-256-GCM-enc 130 MB took 1.017 seconds, 127.889 MB/s Cycles per byte = 17.12
AES-256-GCM-dec 140 MB took 1.030 seconds, 135.943 MB/s Cycles per byte = 16.10
GMAC Table 4-bit 321 MB took 1.002 seconds, 320.457 MB/s Cycles per byte = 6.83
CHACHA          420 MB took 1.002 seconds, 419.252 MB/s Cycles per byte = 5.22
CHA-POLY        330 MB took 1.013 seconds, 325.735 MB/s Cycles per byte = 6.72
MD5              655 MB took 1.007 seconds, 650.701 MB/s Cycles per byte = 3.36
POLY1305        1490 MB took 1.002 seconds, 1486.840 MB/s Cycles per byte = 1.47
SHA              560 MB took 1.004 seconds, 557.620 MB/s Cycles per byte = 3.93
SHA-224          240 MB took 1.011 seconds, 237.474 MB/s Cycles per byte = 9.22
SHA-256          250 MB took 1.020 seconds, 245.081 MB/s Cycles per byte = 8.93
SHA-384          380 MB took 1.005 seconds, 377.963 MB/s Cycles per byte = 5.79
SHA-512          380 MB took 1.007 seconds, 377.260 MB/s Cycles per byte = 5.80
SHA3-224         385 MB took 1.009 seconds, 381.679 MB/s Cycles per byte = 5.74
SHA3-256         360 MB took 1.004 seconds, 358.583 MB/s Cycles per byte = 6.11
SHA3-384         270 MB took 1.020 seconds, 264.606 MB/s Cycles per byte = 8.27
SHA3-512         185 MB took 1.019 seconds, 181.573 MB/s Cycles per byte = 12.06
HMAC-MD5         665 MB took 1.004 seconds, 662.154 MB/s Cycles per byte = 3.31
HMAC-SHA         590 MB took 1.004 seconds, 587.535 MB/s Cycles per byte = 3.73
HMAC-SHA224      240 MB took 1.018 seconds, 235.850 MB/s Cycles per byte = 9.28
HMAC-SHA256      245 MB took 1.013 seconds, 241.805 MB/s Cycles per byte = 9.05
HMAC-SHA384      365 MB took 1.006 seconds, 362.678 MB/s Cycles per byte = 6.04
HMAC-SHA512      365 MB took 1.009 seconds, 361.674 MB/s Cycles per byte = 6.05
PBKDF2           30 KB took 1.000 seconds, 29.956 KB/s Cycles per byte = 74838.56
RSA      2048 public 18400 ops took 1.004 sec, avg 0.055 ms, 18335.019 ops/sec

Benchmark complete

```

This is especially useful for comparing the public key speed before and after changing the math library. You can test the results using the normal math library (`./configure`), the fastmath library (`./configure --enable-fastmath`), and the fastgumath library (`./configure --enable-fastgumath`).

For more details and benchmark results, please refer to the wolfSSL Benchmarks page: <https://www.wolfssl.com/docs/>

3.7.1 Relative Performance

Although the performance of individual ciphers and algorithms will depend on the host platform, the following graph shows relative performance between wolfCrypt's ciphers. These tests were conducted on a Macbook Pro (OS X 10.6.8) running a 2.2 GHz Intel Core i7.

If you want to use only a subset of ciphers, you can customize which specific cipher suites and/or ciphers wolfSSL uses when making an SSL/TLS connection. For example, to force 128-bit AES, add the following line after the call to `wolfSSL_CTX_new(SSL_CTX_new)`:

```
wolfSSL_CTX_set_cipher_list(ctx, "AES128-SHA");
```

3.7.2 Benchmarking Notes

1. The processors native register size (32 vs 64-bit) can make a big difference when doing 1000+ bit public key operations.
2. **keygen** (`--enable-keygen`) will allow you to also benchmark key generation speeds when running the benchmark utility.
3. **fastmath** (`--enable-fastmath`) reduces dynamic memory usage and speeds up public key operations. If you are having trouble building on 32-bit platform with fastmath, disable shared libraries so that PIC isn't hogging a register (also see notes in the README):

```
./configure --enable-fastmath --disable-shared
make clean
make
```

Note: doing a `make clean` is good practice with wolfSSL when switching configure options.

4. By default, fastmath tries to use assembly optimizations if possible. If assembly optimizations don't work, you can still use fastmath without them by adding `TFM_NO_ASM` to `CFLAGS` when building wolfSSL:

```
./configure --enable-fastmath C_EXTRA_FLAGS="-DTFM_NO_ASM"
```

5. Using fasthugemath can try to push fastmath even more for users who are not running on embedded platforms:

```
./configure --enable-fasthugemath
```

6. With the default wolfSSL build, we have tried to find a good balance between memory usage and performance. If you are more concerned about one of the two, please refer back to [Build Options](#) for additional wolfSSL configuration options.
7. **Bulk Transfers:** wolfSSL by default uses 128 byte I/O buffers since about 80% of SSL traffic falls within this size and to limit dynamic memory use. It can be configured to use 16K buffers (the maximum SSL size) if bulk transfers are required.

3.7.3 Benchmarking on Embedded Systems

There are several build options available to make building the benchmark application on an embedded system easier. These include:

3.7.3.1 BENCH_EMBEDDED Enabling this define will switch the benchmark application from using Megabytes to using Kilobytes, therefore reducing the memory usage. By default, when using this define, ciphers and algorithms will be benchmarked with 25kB. Public key algorithms will only be benchmarked over 1 iteration (as public key operations on some embedded processors can be fairly slow). These can be adjusted in `benchmark.c` by altering the variables `numBlocks` and `times` located inside the `BENCH_EMBEDDED` define.

3.7.3.2 USE_CERT_BUFFERS_1024 Enabling this define will switch the benchmark application from loading test keys and certificates from the file system and instead use 1024-bit key and certificate buffers located in `<wolfssl_root>/wolfssl/certs_test.h`. It is useful to use this define when an embedded platform has no filesystem (used with `NO_FILESYSTEM`) and a slow processor where 2048-bit public key operations may not be reasonable.

3.7.3.3 USE_CERT_BUFFERS_2048 Enabling this define is similar to `USE_CERT_BUFFERS_1024` except that 2048-bit key and certificate buffers are used instead of 1024-bit ones. This define is useful when the processor is fast enough to do 2048-bit public key operations but when there is no filesystem available to load keys and certificates from files.

3.8 Changing a Client Application to Use wolfSSL

This section will explain the basic steps needed to add wolfSSL to a client application, using the wolfSSL native API. For a server explanation, please see [Changing a Server Application to Use wolfSSL](#). A more complete walk-through with example code is located in the SSL Tutorial in Chapter 11. If you want more information about the OpenSSL compatibility layer, please see [OpenSSL Compatibility](#).

1. Include the wolfSSL header:

```
#include <wolfssl/ssl.h>
```

2. Initialize wolfSSL and the `WOLFSSL_CTX`. You can use one `WOLFSSL_CTX` no matter how many `WOLFSSL` objects you end up creating. Basically you'll just need to load CA certificates to verify the server you are connecting to. Basic initialization looks like:

```
wolfSSL_Init();
WOLFSSL_CTX* ctx;
if ((ctx = wolfSSL_CTX_new(wolfTLSv1_client_method())) == NULL)
{
    fprintf(stderr, "wolfSSL_CTX_new error.\n");
}
```

```

        exit(EXIT_FAILURE);
    }
    if (wolfSSL_CTX_load_verify_locations(ctx, "./ca-cert.pem", 0) != SSL_SUCCESS) {
        fprintf(stderr, "Error loading ./ca-cert.pem, "
            " please check the file.\n");
        exit(EXIT_FAILURE);
    }

```

3. Create the WOLFSSL object after each TCP connect and associate the file descriptor with the session:

```

/*after connecting to socket fd*/
WOLF SSL* ssl;
if ((ssl = wolfSSL_new(ctx)) == NULL) {
    fprintf(stderr, "wolfSSL_new error.\n");
    exit(EXIT_FAILURE);
}
wolfSSL_set_fd(ssl, fd);

```

4. Change all calls from `read()` (or `recv()`) to `wolfSSL_read()` so:

```
result = read(fd, buffer, bytes);
```

becomes:

```
result = wolfSSL_read(ssl, buffer, bytes);
```

5. Change all calls from `write()` (or `send()`) to `wolfSSL_write()` so:

```
result = write(fd, buffer, bytes);
```

becomes

```
result = wolfSSL_write(ssl, buffer, bytes);
```

6. You can manually call `wolfSSL_connect()` but that's not even necessary; the first call to `wolfSSL_read()` or `wolfSSL_write()` will initiate the `wolfSSL_connect()` if it hasn't taken place yet.

7. Error checking. Each `wolfSSL_read()` and `wolfSSL_write()` call will return the number of bytes written upon success, 0 upon connection closure, and -1 for an error, just like `read()` and `write()`. In the event of an error you can use two calls to get more information about the error:

```

char errorString[80];
int err = wolfSSL_get_error(ssl, 0);
wolfSSL_ERR_error_string(err, errorString);

```

If you are using non-blocking sockets, you can test for `errno` `EAGAIN`/`EWOULDBLOCK` or more correctly you can test the specific error code returned by `wolfSSL_get_error()` for `SSL_ERROR_WANT_READ` or `SSL_ERROR_WANT_WRITE`.

8. Cleanup. After each WOLFSSL object is done being used you can free it up by calling:

```
wolfSSL_free(ssl);
```

When you are completely done using SSL/TLS altogether you can free the WOLFSSL_CTX object by calling:

```

wolfSSL_CTX_free(ctx);
wolfSSL_Cleanup();

```

For an example of a client application using wolfSSL, see the client example located in the `<wolf-ssl-root>/examples/client.c` file.

3.9 Changing a Server Application to Use wolfSSL

This section will explain the basic steps needed to add wolfSSL to a server application using the wolfSSL native API. For a client explanation, please see [Changing a Client Application to Use wolfSSL](#). A more complete walk-through, with example code, is located in the [SSL Tutorial](#) chapter.

1. Follow the instructions above for a client, except change the client method call in step 5 to a server one, so:

```
wolfSSL_CTX_new(wolfTLSv1_client_method());
```

becomes:

```
wolfSSL_CTX_new(wolfTLSv1_server_method());
```

or even:

```
wolfSSL_CTX_new(wolfSSLv23_server_method());
```

To allow SSLv3 and TLSv1+ clients to connect to the server.

2. Add the server's certificate and key file to the initialization in step 5 above:

```
if (wolfSSL_CTX_use_certificate_file(ctx, "./server-cert.pem", SSL_FILETYPE_PEM) != SSL_SUCCESS) {
    fprintf(stderr, "Error loading ./server-cert.pem, "
        " please check the file.\n");
    exit(EXIT_FAILURE);
}
if (wolfSSL_CTX_use_PrivateKey_file(ctx, "./server-key.pem", SSL_FILETYPE_PEM) != SSL_SUCCESS) {
    fprintf(stderr, "Error loading ./server-key.pem, "
        " please check the file.\n");
    exit(EXIT_FAILURE);
}
```

It is possible to load certificates and keys from buffers as well if there is no filesystem available. In this case, see the [wolfSSL_CTX_use_certificate_buffer\(\)](#) and [wolfSSL_CTX_use_PrivateKey_buffer\(\)](#) API documentation, linked here, for more information.

For an example of a server application using wolfSSL, see the server example located in the `<wolf-ssl_root>/examples/server.c` file.

4 Features

wolfSSL (formerly CyaSSL) supports the C programming language as a primary interface, but also supports several other host languages, including Java, PHP, Perl, and Python (through a [SWIG](#) interface). If you have interest in hosting wolfSSL in another programming language that is not currently supported, please contact us.

This chapter covers some of the features of wolfSSL in more depth, including Stream Ciphers, AES-NI, IPv6 support, SSL Inspection (Sniffer) support, and more.

4.1 Features Overview

For an overview of wolfSSL features, please reference the wolfSSL product webpage: <https://www.wolfssl.com/product>

4.2 Protocol Support

wolfSSL supports **SSL 3.0**, ****TLS (1.0, 1.1, 1.2, 1.3)**, and ****DTLS (**1.0 **and 1.2)**. You can easily select a protocol to use by using one of the following functions (as shown for either the client or server).

wolfSSL does not support SSL 2.0, as it has been insecure for several years. The client and server functions below change slightly when using the OpenSSL compatibility layer. For the OpenSSL-compatible functions, please see [OpenSSL Compatibility](#).

4.2.1 Server Functions

- `wolfDTLSv1_server_method()` - DTLS 1.0
- `wolfDTLSv1_2_server_method()` - DTLS 1.2
- `wolfSSLv3_server_method()` - SSL 3.0
- `wolfTLSv1_server_method()` - TLS 1.0
- `wolfTLSv1_1_server_method()` - TLS 1.1
- `wolfTLSv1_2_server_method()` - TLS 1.2
- `wolfTLSv1_3_server_method()` - TLS 1.3
- `wolfSSLv23_server_method()` - Use highest possible version from SSLv3 - TLS 1.2

wolfSSL supports robust server downgrade with the `wolfSSLv23_server_method()` function. See [Robust Client and Server Downgrade](#) for a details.

4.2.2 Client Functions

- `wolfDTLSv1_client_method()` - DTLS 1.0
- `wolfDTLSv1_2_client_method_ex()` - DTLS 1.2
- `wolfSSLv3_client_method()` - SSL 3.0
- `wolfTLSv1_client_method()` - TLS 1.0
- `wolfTLSv1_1_client_method()` - TLS 1.1
- `wolfTLSv1_2_client_method()` - TLS 1.2
- `wolfTLSv1_3_client_method()` - TLS 1.3
- `wolfSSLv23_client_method()` - Use highest possible version from SSLv3 - TLS 1.2

wolfSSL supports robust client downgrade with the `wolfSSLv23_client_method()` function. See [Robust Client and Server Downgrade](#) for a details.

For details on how to use these functions, please see the [Getting Started](#) chapter. For a comparison between SSL 3.0, TLS 1.0, 1.1, 1.2, and DTLS, please see Appendix A.

4.2.3 Robust Client and Server Downgrade

Both wolfSSL clients and servers have robust version downgrade capability. If a specific protocol version method is used on either side, then only that version will be negotiated or an error will be returned. For example, a client that uses TLS 1.0 and tries to connect to an SSL 3.0 only server, the connection will fail, likewise connecting to a TLS 1.1 will fail as well.

To resolve this issue, a client that uses the `wolfSSLv23_client_method()` function will support the highest protocol version supported by the server by downgrading if necessary. In this case, the client will be able to connect to a server running TLS 1.0 - TLS 1.3 (or a subset or superset that includes SSL 3.0 depending on which protocol versions are configured in wolfSSL). The only versions it can't connect to is SSL 2.0 which has been insecure for years, and SSL 3.0 which has been disabled by default.

Similarly, a server using the `wolfSSLv23_server_method()` function can handle clients supporting protocol versions from TLS 1.0 - TLS 1.2. A wolfSSL server can't accept a connection from SSLv2 because no security is provided.

4.2.4 IPv6 Support

If you are an adopter of IPv6 and want to use an embedded SSL implementation then you may have been wondering if wolfSSL supports IPv6. The answer is yes, we do support wolfSSL running on top

of IPv6.

wolfSSL was designed as IP neutral, and will work with both IPv4 and IPv6, but the current test applications default to IPv4 (so as to apply to a broader range of systems). To change the test applications to IPv6, use the `**--enable-ipv6**` option while building wolfSSL.

Further information on IPv6 can be found here:

<https://en.wikipedia.org/wiki/IPv6>.

4.2.5 DTLS

wolfSSL has support for DTLS (“Datagram” TLS) for both client and server. The current supported version is DTLS 1.0.

The TLS protocol was designed to provide a secure transport channel across a **reliable** medium (such as TCP). As application layer protocols began to be developed using UDP transport (such as SIP and various electronic gaming protocols), a need arose for a way to provide communications security for applications which are delay sensitive. This need led to the creation of the DTLS protocol.

Many people believe the difference between TLS and DTLS is the same as TCP vs. UDP. This is incorrect. UDP has the benefit of having no handshake, no tear-down, and no delay in the middle if something gets lost (compared with TCP). DTLS on the other hand, has an extended SSL handshake and tear-down and must implement TCP-like behavior for the handshake. In essence, DTLS reverses the benefits that are offered by UDP in exchange for a secure connection.

DTLS can be enabled when building wolfSSL by using the `--enable-dtls` build option.

4.2.6 LwIP (Lightweight Internet Protocol)

wolfSSL supports the lightweight internet protocol implementation out of the box. To use this protocol all you need to do is define `WOLFSSL_LWIP` or navigate to the `settings.h` file and uncomment the line:

```
/*#define WOLFSSL_LWIP*/
```

The focus of LwIP is to reduce RAM usage while still providing a full TCP stack. That focus makes LwIP great for use in embedded systems, an area where wolfSSL is an ideal match for SSL/TLS needs.

4.2.7 TLS Extensions

A list of TLS extensions supported by wolfSSL and note of which RFC can be referenced for the given extension.

RFC	Extension	wolfSSL Type
6066	Server Name Indication	TLSX_SERVER_NAME
6066	Maximum Fragment Length Negotiation	TLSX_MAX_FRAGMENT_LENGTH
6066	Truncated HMAC	TLSX_TRUNCATED_HMAC
6066	Status Request	TLSX_STATUS_REQUEST
7919	Supported Groups	TLSX_SUPPORTED_GROUPS
5246	Signature Algorithm	TLSX_SIGNATURE_ALGORITHMS
7301	Application Layer Protocol Negotiation	TLSX_APPLICATION_LAYER_PROTOCOL
6961	Multiple Certificate Status Request	TLSX_STATUS_REQUEST_V2
Draft	Quantum-Safe Hybrid Key Exchange	TLSX_QUANTUM_SAFE_HYBRID
5077	Session Ticket	TLSX_SESSION_TICKET
5746	Renegotiation Indication	TLSX_RENEGOTIATION_INFO
8446	Key Share	TLSX_KEY_SHARE

RFC	Extension	wolfSSL Type
8446	Pre Shared Key	TLSX_PRE_SHARED_KEY
8446	PSK Key Exchange Modes	TLSX_PSK_KEY_EXCHANGE_MODES
8446	Early Data	TLSX_EARLY_DATA
8446	Cookie	TLSX_COOKIE
8446	Supported Versions	TLSX_SUPPORTED_VERSIONS
8446	Post Handshake Authorization	TLSX_POST_HANDSHAKE_AUTH

4.3 Cipher Support

4.3.1 Cipher Suite Strength and Choosing Proper Key Sizes

To see what ciphers are currently being used you can call the method: `wolfSSL_get_ciphers()`.

This function will return the currently enabled cipher suites.

Cipher suites come in a variety of strengths. Because they are made up of several different types of algorithms (authentication, encryption, and message authentication code (MAC)), the strength of each varies with the chosen key sizes.

There can be many methods of grading the strength of a cipher suite - the specific method used seems to vary between different projects and companies and can include things such as symmetric and public key algorithm key sizes, type of algorithm, performance, and known weaknesses.

NIST (National Institute of Standards and Technology) makes recommendations on choosing an acceptable cipher suite by providing comparable algorithm strengths for varying key sizes of each. The strength of a cryptographic algorithm depends on the algorithm and the key size used. The NIST Special Publication, [SP800-57](#), states that two algorithms are considered to be of comparable strength as follows:

Two algorithms are considered to be of comparable strength for the given key sizes (X and Y) if the amount of work needed to “break the algorithms” or determine the keys (with the given key sizes) is approximately the same using a given resource. The security strength of an algorithm for a given key size is traditionally described in terms of the amount of work it takes to try all keys for a symmetric algorithm with a key size of “X” that has no shortcut attacks (i.e., the most efficient attack is to try all possible keys).

The following two tables are based off of both Table 2 (pg. 56) and Table 4 (pg. 59) from [NIST SP800-57](#), and shows comparable security strength between algorithms as well as a strength measurement (based off of NIST’s suggested algorithm security lifetimes using bits of security).

Note: In the following table “L” is the size of the public key for finite field cryptography (FFC), “N” is the size of the private key for FFC, “k” is considered the key size for integer factorization cryptography (IFC), and “f” is considered the key size for elliptic curve cryptography.

Bits of Security	Symmetric Key Algorithms	FFC Key Size (DSA, DH, etc.)	IFC Key Size (RSA, etc.)	ECC Key Size (E)
80	2TDEA, etc.	L = 1024, N = 160	k = 1024	f = 160-223
128	AES-128, etc.	L = 3072, N = 256	k = 3072	f = 256-383
192	AES-192, etc.	L = 7680, N = 384	k = 7680	f = 384-511
256	AES-256, etc.	L = 15360, N = 512	k = 15360	f = 512+

Using this table as a guide, to begin to classify a cipher suite, we categorize it based on the strength of the symmetric encryption algorithm. In doing this, a rough grade classification can be devised to classify each cipher suite based on bits of security (only taking into account symmetric key size):

- **LOW** - bits of security smaller than 128 bits
- **MEDIUM** - bits of security equal to 128 bits
- **HIGH** - bits of security larger than 128 bits

Outside of the symmetric encryption algorithm strength, the strength of a cipher suite will depend greatly on the key sizes of the key exchange and authentication algorithm keys. The strength is only as good as the cipher suite's weakest link.

Following the above grading methodology (and only basing it on symmetric encryption algorithm strength), wolfSSL 2.0.0 currently supports a total of 0 LOW strength cipher suites, 12 MEDIUM strength cipher suites, and 8 HIGH strength cipher suites – as listed below. The following strength classification could change depending on the chosen key sizes of the other algorithms involved. For a reference on hash function security strength, see Table 3 (pg. 56) of [NIST SP800-57](#).

In some cases, you will see ciphers referenced as “**EXPORT**” ciphers. These ciphers originated from the time period in US history (as late as 1992) when it was illegal to export software with strong encryption from the United States. Strong encryption was classified as “Munitions” by the US Government (under the same category as Nuclear Weapons, Tanks, and Ballistic Missiles). Because of this restriction, software being exported included “weakened” ciphers (mostly in smaller key sizes). In the current day, this restriction has been lifted, and as such, EXPORT ciphers are no longer a mandated necessity.

4.3.2 Supported Cipher Suites

The following cipher suites are supported by wolfSSL. A cipher suite is a combination of authentication, encryption, and message authentication code (MAC) algorithms which are used during the TLS or SSL handshake to negotiate security settings for a connection.

Each cipher suite defines a key exchange algorithm, a bulk encryption algorithm, and a message authentication code algorithm (MAC). The **key exchange algorithm** (RSA, DSS, DH, EDH) determines how the client and server will authenticate during the handshake process. The **bulk encryption algorithm** (DES, 3DES, AES, ARC4, RABBIT, HC-128), including block ciphers and stream ciphers, is used to encrypt the message stream. The **message authentication code (MAC) algorithm** (MD2, MD5, SHA-1, SHA-256, SHA-512, RIPEMD) is a hash function used to create the message digest.

The table below matches up to the cipher suites (and categories) found in `<wolfssl_root>/wolfssl/internal.h` (starting at about line 706). If you are looking for a cipher suite which is not in the following list, please contact us to discuss getting it added to wolfSSL.

ECC cipher suites:

- TLS_DHE_RSA_WITH_3DES_EDE_CBC_SHA
- TLS_DHE_RSA_WITH_AES_256_CBC_SHA
- TLS_DHE_RSA_WITH_AES_128_CBC_SHA
- TLS_DH_anon_WITH_AES_128_CBC_SHA
- TLS_RSA_WITH_AES_256_CBC_SHA
- TLS_RSA_WITH_AES_128_CBC_SHA
- TLS_RSA_WITH_NULL_SHA
- TLS_PSK_WITH_AES_256_CBC_SHA
- TLS_PSK_WITH_AES_128_CBC_SHA256
- TLS_PSK_WITH_AES_256_CBC_SHA384
- TLS_PSK_WITH_AES_128_CBC_SHA
- TLS_PSK_WITH_NULL_SHA256
- TLS_PSK_WITH_NULL_SHA384
- TLS_PSK_WITH_NULL_SHA
- SSL_RSA_WITH_RC4_128_SHA
- SSL_RSA_WITH_RC4_128_MD5
- SSL_RSA_WITH_3DES_EDE_CBC_SHA

- SSL_RSA_WITH_IDEA_CBC_SHA
- TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA
- TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA
- TLS_ECDHE_ECDSA_WITH_AES_256_CBC_SHA
- TLS_ECDHE_ECDSA_WITH_AES_128_CBC_SHA
- TLS_ECDHE_RSA_WITH_RC4_128_SHA
- TLS_ECDHE_ECDSA_WITH_RC4_128_SHA
- TLS_ECDHE_RSA_WITH_3DES_EDE_CBC_SHA
- TLS_ECDHE_ECDSA_WITH_3DES_EDE_CBC_SHA
- TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA256
- TLS_ECDHE_ECDSA_WITH_AES_128_CBC_SHA256
- TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA384
- TLS_ECDHE_ECDSA_WITH_AES_256_CBC_SHA384
- TLS_ECDHE_PSK_WITH_NULL_SHA256
- TLS_ECDHE_PSK_WITH_AES_128_CBC_SHA256
- TLS_ECDHE_ECDSA_WITH_NULL_SHA

Static ECC cipher suites:

- TLS_ECDH_RSA_WITH_AES_256_CBC_SHA
- TLS_ECDH_RSA_WITH_AES_128_CBC_SHA
- TLS_ECDH_ECDSA_WITH_AES_256_CBC_SHA
- TLS_ECDH_ECDSA_WITH_AES_128_CBC_SHA
- TLS_ECDH_RSA_WITH_RC4_128_SHA
- TLS_ECDH_ECDSA_WITH_RC4_128_SHA
- TLS_ECDH_RSA_WITH_3DES_EDE_CBC_SHA
- TLS_ECDH_ECDSA_WITH_3DES_EDE_CBC_SHA
- TLS_ECDH_RSA_WITH_AES_128_CBC_SHA256
- TLS_ECDH_ECDSA_WITH_AES_128_CBC_SHA256
- TLS_ECDH_RSA_WITH_AES_256_CBC_SHA384
- TLS_ECDH_ECDSA_WITH_AES_256_CBC_SHA384

wolfSSL extension - eSTREAM cipher suites:

- TLS_RSA_WITH_HC_128_MD5
- TLS_RSA_WITH_HC_128_SHA
- TLS_RSA_WITH_RABBIT_SHA

Blake2b cipher suites:

- TLS_RSA_WITH_AES_128_CBC_B2B256
- TLS_RSA_WITH_AES_256_CBC_B2B256
- TLS_RSA_WITH_HC_128_B2B256

wolfSSL extension - Quantum-Safe Handshake:

- TLS_QSH

wolfSSL extension - NTRU cipher suites:

- TLS_NTRU_RSA_WITH_RC4_128_SHA
- TLS_NTRU_RSA_WITH_3DES_EDE_CBC_SHA
- TLS_NTRU_RSA_WITH_AES_128_CBC_SHA
- TLS_NTRU_RSA_WITH_AES_256_CBC_SHA

SHA-256 cipher suites:

- TLS_DHE_RSA_WITH_AES_256_CBC_SHA256
- TLS_DHE_RSA_WITH_AES_128_CBC_SHA256
- TLS_RSA_WITH_AES_256_CBC_SHA256

- TLS_RSA_WITH_AES_128_CBC_SHA256
- TLS_RSA_WITH_NULL_SHA256
- TLS_DHE_PSK_WITH_AES_128_CBC_SHA256
- TLS_DHE_PSK_WITH_NULL_SHA256

SHA-384 cipher suites:

- TLS_DHE_PSK_WITH_AES_256_CBC_SHA384
- TLS_DHE_PSK_WITH_NULL_SHA384

AES-GCM cipher suites:

- TLS_RSA_WITH_AES_128_GCM_SHA256
- TLS_RSA_WITH_AES_256_GCM_SHA384
- TLS_DHE_RSA_WITH_AES_128_GCM_SHA256
- TLS_DHE_RSA_WITH_AES_256_GCM_SHA384
- TLS_PSK_WITH_AES_128_GCM_SHA256
- TLS_PSK_WITH_AES_256_GCM_SHA384
- TLS_DHE_PSK_WITH_AES_128_GCM_SHA256
- TLS_DHE_PSK_WITH_AES_256_GCM_SHA384

ECC AES-GCM cipher suites:

- TLS_ECDHE_ECDSA_WITH_AES_128_GCM_SHA256
- TLS_ECDHE_ECDSA_WITH_AES_256_GCM_SHA384
- TLS_ECDH_ECDSA_WITH_AES_128_GCM_SHA256
- TLS_ECDH_ECDSA_WITH_AES_256_GCM_SHA384
- TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256
- TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384
- TLS_ECDH_RSA_WITH_AES_128_GCM_SHA256
- TLS_ECDH_RSA_WITH_AES_256_GCM_SHA384

AES-CCM cipher suites:

- TLS_RSA_WITH_AES_128_CCM_8
- TLS_RSA_WITH_AES_256_CCM_8
- TLS_ECDHE_ECDSA_WITH_AES_128_CCM
- TLS_ECDHE_ECDSA_WITH_AES_128_CCM_8
- TLS_ECDHE_ECDSA_WITH_AES_256_CCM_8
- TLS_PSK_WITH_AES_128_CCM
- TLS_PSK_WITH_AES_256_CCM
- TLS_PSK_WITH_AES_128_CCM_8
- TLS_PSK_WITH_AES_256_CCM_8
- TLS_DHE_PSK_WITH_AES_128_CCM
- TLS_DHE_PSK_WITH_AES_256_CCM

Camellia cipher suites:

- TLS_RSA_WITH_CAMELLIA_128_CBC_SHA
- TLS_RSA_WITH_CAMELLIA_256_CBC_SHA
- TLS_RSA_WITH_CAMELLIA_128_CBC_SHA256
- TLS_RSA_WITH_CAMELLIA_256_CBC_SHA256
- TLS_DHE_RSA_WITH_CAMELLIA_128_CBC_SHA
- TLS_DHE_RSA_WITH_CAMELLIA_256_CBC_SHA
- TLS_DHE_RSA_WITH_CAMELLIA_128_CBC_SHA256
- TLS_DHE_RSA_WITH_CAMELLIA_256_CBC_SHA256

ChaCha cipher suites:

- TLS_ECDHE_RSA_WITH_CHACHA20_POLY1305_SHA256

- TLS_ECDHE_ECDSA_WITH_CHACHA20_POLY1305_SHA256
- TLS_DHE_RSA_WITH_CHACHA20_POLY1305_SHA256
- TLS_ECDHE_PSK_WITH_CHACHA20_POLY1305_SHA256
- TLS_PSK_WITH_CHACHA20_POLY1305_SHA256
- TLS_DHE_PSK_WITH_CHACHA20_POLY1305_SHA256
- TLS_ECDHE_RSA_WITH_CHACHA20_OLD_POLY1305_SHA256
- TLS_ECDHE_ECDSA_WITH_CHACHA20_OLD_POLY1305_SHA256
- TLS_DHE_RSA_WITH_CHACHA20_OLD_POLY1305_SHA256

Renegotiation Indication Extension Special Suite:

- TLS_EMPTY_RENEGOTIATION_INFO_SCSV

4.3.3 AEAD Suites

wolfSSL supports AEAD suites, including AES-GCM, AES-CCM, and CHACHA-POLY1305. The big difference between these AEAD suites and others is that they authenticate the encrypted data with any additional cleartext data. This helps with mitigating man in the middle attacks that result in having data tampered with. AEAD suites use a combination of a block cipher (or more recently also a stream cipher) algorithm combined with a tag produced by a keyed hash algorithm. Combining these two algorithms is handled by the wolfSSL encrypt and decrypt process which makes it easier for users. All that is needed for using a specific AEAD suite is simply enabling the algorithms that are used in a supported suite.

4.3.4 Block and Stream Ciphers

wolfSSL supports the **AES**, **DES**, **3DES**, and **Camellia** block ciphers and the **RC4**, **RABBIT**, **HC-128** and ****CHACHA20**** stream ciphers. AES, DES, 3DES, RC4 and RABBIT are enabled by default. Camellia, HC-128, and ChaCha20 can be enabled when building wolfSSL (with the **--enable-hc128**, **--enable-camellia**, and **--disable-chacha** build options, respectively). The default mode of AES is CBC mode. To enable GCM or CCM mode with AES, use the **--enable-aesgcm** and **--enable-aesccm** build options. Please see the examples for usage and the [wolfCrypt Usage Reference](#) for specific usage information.

While SSL uses RC4 as the default stream cipher, it has been obsoleted due to compromise. wolfSSL has added two ciphers from the eStream project into the code base, RABBIT and HC-128. RABBIT is nearly twice as fast as RC4 and HC-128 is about 5 times as fast! So if you've ever decided not to use SSL because of speed concerns, using wolfSSL's stream ciphers should lessen or eliminate that performance doubt. Recently wolfSSL also added ChaCha20. While RC4 is about 11% more performant than ChaCha, RC4 is generally considered less secure than ChaCha. ChaCha can put up very nice times of it's own with added security as a tradeoff.

To see a comparison of cipher performance, visit the wolfSSL Benchmark web page, located here: <https://www.wolfssl.com/docs/benchmarks>.

4.3.4.1 What's the Difference? A block cipher has to be encrypted in chunks that are the block size for the cipher. For example, AES has a block size of 16 bytes. So if you're encrypting a bunch of small, 2 or 3 byte chunks back and forth, over 80% of the data is useless padding, decreasing the speed of the encryption/decryption process and needlessly wasting network bandwidth to boot. Basically block ciphers are designed for large chunks of data, have block sizes requiring padding, and use a fixed, unvarying transformation.

Stream ciphers work well for large or small chunks of data. They are suitable for smaller data sizes because no block size is required. If speed is a concern, stream ciphers are your answer, because they use a simpler transformation that typically involves an xor'd keystream. So if you need to stream

media, encrypt various data sizes including small ones, or have a need for a fast cipher then stream ciphers are your best bet.

4.3.5 Hashing Functions

wolfSSL supports several different hashing functions, including **MD2**, **MD4**, **MD5**, **SHA-1**, **SHA-2** (SHA-224, SHA-256, SHA-384, SHA-512), **SHA-3** (BLAKE2), and **RIPEMD-160**. Detailed usage of these functions can be found in the wolfCrypt Usage Reference, [Hash Functions](#).

4.3.6 Public Key Options

wolfSSL supports the **RSA**, **ECC**, **DSA/DSS**, **DH**, and **NTRU** public key options, with support for **EDH** (Ephemeral Diffie-Hellman) on the wolfSSL server. Detailed usage of these functions can be found in the wolfCrypt Usage Reference, [Public Key Cryptography](#).

wolfSSL has support for four cipher suites utilizing NTRU public key:

- TLS_NTRU_RSA_WITH_3DES_EDE_CBC_SHA
- TLS_NTRU_RSA_WITH_RC4_128_SHA
- TLS_NTRU_RSA_WITH_AES_128_CBC_SHA
- TLS_NTRU_RSA_WITH_AES_256_CBC_SHA

The strongest one, AES-256, is the default. If wolfSSL is enabled with NTRU and the NTRU library is available, these cipher suites are built into the wolfSSL library. A wolfSSL client will have these cipher suites available without any interaction needed by the user. On the other hand, a wolfSSL server application will need to load an NTRU private key and NTRU x509 certificate in order for those cipher suites to be available for use.

The example servers, echoserver and server, both use the define HAVE_NTRU (which is turned on by enabling NTRU) to specify whether or not to load NTRU keys and certificates. The wolfSSL package comes with test keys and certificates in the /certs directory. ntru-cert.pem is the certificate and ntru-key.raw is the private key blob.

The wolfSSL NTRU cipher suites are given the highest preference order when the protocol picks a suite. Their exact preference order is the reverse of the above listed suites, i.e., AES-256 will be picked first and 3DES last before moving onto the “standard” cipher suites. Basically, if a user builds NTRU into wolfSSL and both sides of the connection support NTRU then an NTRU cipher suite will be picked unless a user on one side has explicitly excluded them by stating to only use different cipher suites. Using NTRU over RSA can provide a 20 - 200X speed improvement. The improvement increases as the size of keys increases, meaning a much larger speed benefit when using large keys (8192-bit) versus smaller keys (1024-bit).

4.3.7 ECC Support

wolfSSL has support for Elliptic Curve Cryptography (ECC) including but not limited to: ECDH-ECDSA, ECDHE-ECDSA, ECDH-RSA, ECDHE-PSK and ECDHE-RSA.

wolfSSL's ECC implementation can be found in the <wolfssl_root>/wolfssl/wolfcrypt/ecc.h header file and the <wolfssl_root>/wolfcrypt/src/ecc.c source file.

Supported cipher suites are shown in the table above. ECC is disabled by default on non x86_64 builds, but can be turned on when building wolfSSL with the HAVE_ECC define or by using the autoconf system:

```
./configure --enable-ecc
make
make check
```

When `make check` runs, note the numerous cipher suites that wolfSSL checks (if `make check` doesn't produce a list of cipher suites run `./testsuite/testsuite.test` on its own). Any of these cipher suites can be tested individually, e.g., to try ECDH-ECDSA with AES256-SHA, the example wolfSSL server can be started like this:

```
./examples/server/server -d -l ECDHE-ECDSA-AES256-SHA -c ./certs/server-ecc.pem -k ./certs/
```

(-d) disables client cert check while (-l) specifies the cipher suite list. (-c) is the certificate to use and (-k) is the corresponding private key to use. To have the client connect try:

```
./examples/client/client -A ./certs/server-ecc.pem
```

where (-A) is the CA certificate to use to verify the server.

4.3.8 PKCS Support

PKCS (Public Key Cryptography Standards) refers to a group of standards created and published by RSA Security, Inc. wolfSSL has support for **PKCS #1, PKCS #3, PKCS #5, PKCS #7, PKCS #8, PKCS #9, PKCS #10, PKCS #11, and PKCS #12**.

Additionally, wolfSSL also provides support for RSA-Probabilistic Signature Scheme (PSS), which is standardized as part of PKCS #1.

4.3.8.1 PKCS #5, PBKDF1, PBKDF2, PKCS #12 PKCS #5 is a password based key derivation method which combines a password, a salt, and an iteration count to generate a password-based key. wolfSSL supports both PBKDF1 and PBKDF2 key derivation functions. A key derivation function produces a derived key from a base key and other parameters (such as the salt and iteration count as explained above). PBKDF1 applies a hash function (MD5, SHA1, etc) to derive keys, where the derived key length is bounded by the length of the hash function output. With PBKDF2, a pseudorandom function is applied (such as HMAC-SHA-1) to derive the keys. In the case of PBKDF2, the derived key length is unbounded.

wolfSSL also supports the PBKDF function from PKCS #12 in addition to PBKDF1 and PBKDF2. The function prototypes look like this:

```
int PBKDF2(byte* output, const byte* passwd, int pLen,
           const byte* salt, int sLen, int iterations,
           int kLen, int hashType);
```

```
int PKCS12_PBKDF(byte* output, const byte* passwd, int pLen,
                 const byte* salt, int sLen, int iterations,
                 int kLen, int hashType, int purpose);
```

output contains the derived key, passwd holds the user password of length pLen, salt holds the salt input of length sLen, iterations is the number of iterations to perform, kLen is the desired derived key length, and hashType is the hash to use (which can be MD5, SHA1, or SHA2).

If you are using `./configure` to build wolfssl, the way to enable this functionality is to use the option `--enable-pwdbased`

A full example can be found in `<wolfSSL Root>/wolfcrypt/test.c`. More information can be found on PKCS #5, PBKDF1, and PBKDF2 from the following specifications:

PKCS#5, PBKDF1, PBKDF2: <https://tools.ietf.org/html/rfc2898>

4.3.8.2 PKCS #8 PKCS #8 is designed as the Private-Key Information Syntax Standard, which is used to store private key information - including a private key for some public-key algorithm and set of attributes.

The PKCS #8 standard has two versions which describe the syntax to store both encrypted private keys and non-encrypted keys. wolfSSL supports both unencrypted and encrypted PKCS #8. Supported formats include PKCS #5 version 1 - version 2, and PKCS#12. Types of encryption available include DES, 3DES, RC4, and AES.

PKCS#8: <https://tools.ietf.org/html/rfc5208>

4.3.8.3 PKCS #7 PKCS #7 is designed to transfer bundles of data whether is an enveloped certificate or unencrypted but signed string of data. The functionality is turned on by using the enable option (`--enable-pkcs7`) or by using the macro HAVE_PKCS7. Note that degenerate cases are allowed by default as per the RFC having an empty set of signers. To toggle allowing degenerate cases on and off the function `wc_PKCS7_AllowDegenerate()` can be called.

Supported features include:

- Degenerate bundles
- KARI, KEKRI, PWRI, ORI, KTRI bundles
- Detached signatures
- Compressed and Firmware package bundles
- Custom callback support
- Limited streaming capability

4.3.8.3.1 PKCS #7 Callbacks Additional callbacks and supporting functions were added to allow for a user to choose their keys after the PKCS7 bundle has been parsed. For unwrapping the CEK the function `wc_PKCS7_SetWrapCEKCb()` can be called. The callback set by this function gets called in the case of KARI and KEKRI bundles. The keyID or SKID gets passed from wolfSSL to the user along with the originator key in the case of KARI. After the user unwraps the CEK with their KEK the decrypted key to be used should then be passed back to wolfSSL. An example of this can be found in the wolfssl-examples repository in the file `signedData-EncryptionFirmwareCB.c`.

An additional callback was added for decryption of PKCS7 bundles. For setting a decryption callback function the API `wc_PKCS7_SetDecodeEncryptedCb()` can be used. To set a user defined context the API `wc_PKCS7_SetDecodeEncryptedCtx()` should be used. This callback will get executed on calls to `wc_PKCS7_DecodeEncryptedData()`.

4.3.8.3.2 PKCS #7 Streaming Stream oriented API for PKCS7 decoding gives the option of passing inputs in smaller chunks instead of all at once. By default the streaming functionality with PKCS7 is on. To turn off support for streaming PKCS7 API the macro `NO_PKCS7_STREAM` can be defined. An example of doing this with autotools would be `./configure --enable-pkcs7 CFLAGS=-DNO_PKCS7_STREAM`.

For streaming when decoding/verifying bundles the following functions are supported:

1. `wc_PKCS7_DecodeEncryptedData()`
2. `wc_PKCS7_VerifySignedData()`
3. `wc_PKCS7_VerifySignedData_ex()`
4. `wc_PKCS7_DecodeEnvelopedData()`
5. `wc_PKCS7_DecodeAuthEnvelopedData()`

Note: that when calling `wc_PKCS7_VerifySignedData_ex` it is expected that the argument `pkiMsg-Footer` is the full buffer. The internal structure only supports streaming of one buffer which in this case would be `pkiMsgHeader`.

4.3.9 Forcing the Use of a Specific Cipher

By default, wolfSSL will pick the “best” (highest security) cipher suite that both sides of the connection can support. To force a specific cipher, such as 128 bit AES, add something similar to:

```
wolfSSL_CTX_set_cipher_list(ctx, "AES128-SHA");
```

after the call to `wolfSSL_CTX_new()` so that you have:

```
ctx = wolfSSL_CTX_new(method);  
wolfSSL_CTX_set_cipher_list(ctx, "AES128-SHA");
```

4.3.10 Quantum-Safe Handshake Ciphersuite

wolfSSL has support for the cipher suite utilizing post quantum handshake cipher suite such as with NTRU: TLS_QSH

If wolfSSL is enabled with NTRU and the NTRU package is available, the TLS_QSH cipher suite is built into the wolfSSL library. A wolfSSL client and server will have this cipher suite available without any interaction needed by the user.

The wolfSSL quantum safe handshake ciphersuite is given the highest preference order when the protocol picks a suite. Basically, if a user builds NTRU into wolfSSL and both sides of the connection support NTRU then an NTRU cipher suite will be picked unless a user on one side has explicitly excluded them by stating to only use different cipher suites.

Users can adjust what crypto algorithms and if the client sends across public keys by using the function examples:

```
wolfSSL_UseClientQSHKeys(ssl, 1);  
wolfSSL_UseSupportedQSH(ssl, WOLFSSL_NTRU_EESS439);
```

To test if a QSH connection was established after a client has connected the following function example can be used:

```
wolfSSL_isQSH(ssl);
```

4.4 Hardware Accelerated Crypto

wolfSSL is able to take advantage of several hardware accelerated (or “assisted”) crypto functionalities in various processors and chips. The following sections explain which technologies wolfSSL supports out-of-the-box.

4.4.1 AES-NI

AES is a key encryption standard used by governments worldwide, which wolfSSL has always supported. Intel has released a new set of instructions that is a faster way to implement AES. wolfSSL is the first SSL library to fully support the new instruction set for production environments.

Essentially, Intel and AMD have added AES instructions at the chip level that perform the computationally-intensive parts of the AES algorithm, boosting performance. For a list of Intel’s chips that currently have support for AES-NI, you can look here:

<https://ark.intel.com/search/advanced/?s=t&AESTech=true>

We have added the functionality to wolfSSL to allow it to call the instructions directly from the chip, instead of running the algorithm in software. This means that when you’re running wolfSSL on a chipset that supports AES-NI, you can run your AES crypto 5-10 times faster!

If you are running on an AES-NI supported chipset, enable AES-NI with the `--enable-aesni` build option. To build wolfSSL with AES-NI, GCC 4.4.3 or later is required to make use of the assembly code. wolfSSL supports the ASM instructions on AMD processors using the same build options.

References and further reading on AES-NI, ordered from general to specific, are listed below. For information about performance gains with AES-NI, please see the third link to the Intel Software Network page.

- [AES \(Wikipedia\)](#)
- [AES-NI \(Wikipedia\)](#)
- [AES-NI \(Intel Software Network page\)](#)

AES-NI will accelerate the following AES cipher modes: AES-CBC, AES-GCM, AES-CCM-8, AES-CCM, and AES-CTR. AES-GCM is further accelerated with the use of the 128-bit multiply function added to the Intel chips for the GHASH authentication.

4.4.2 STM32F2

wolfSSL is able to use the STM32F2 hardware-based cryptography and random number generator through the STM32F2 Standard Peripheral Library.

For necessary defines, see the `WOLFSSL_STM32F2` define in `settings.h`. The `WOLFSSL_STM32F2` define enables STM32F2 hardware crypto and RNG support by default. The defines for enabling these individually are `STM32F2_CRYPT0` (for hardware crypto support) and `STM32F2_RNG` (for hardware RNG support).

Documentation for the STM32F2 Standard Peripheral Library can be found in the following document: [https://www.st.com/internet/com/TECHNICAL_RESOURCES/TECHNICAL_LITERATURE/USER_MANUAL/DM00023896.p](https://www.st.com/internet/com/TECHNICAL_RESOURCES/TECHNICAL_LITERATURE/USER_MANUAL/DM00023896.pdf)

4.4.3 Cavium NITROX

wolfSSL has support for Cavium NITROX (https://www.cavium.com/processor_security.html). To enable Cavium NITROX support when building wolfSSL use the following configure option:

```
./configure --with-cavium=/home/user/cavium/software
```

Where the `--with-cavium=**` option is pointing to your licensed cavium/software directory. Since Cavium doesn't build a library wolfSSL pulls in the `cavium_common.o` file which gives a libtool warning about the portability of this. Also, if you're using the github source tree you'll need to remove the `-Wredundant-decls` warning from the generated Makefile because the cavium headers don't conform to this warning.

Currently wolfSSL supports Cavium RNG, AES, 3DES, RC4, HMAC, and RSA directly at the crypto layer. Support at the SSL level is partial and currently just does AES, 3DES, and RC4. RSA and HMAC are slower until the Cavium calls can be utilized in non-blocking mode. The example client turns on cavium support as does the crypto test and benchmark. Please see the `HAVE_CAVIUM` define.

4.4.4 ESP32-WROOM-32

wolfSSL is able to use the ESP32-WROOM-32 hardware-based cryptography.

For necessary defines, see the `WOLFSSL_ESPWROOM32` define in `settings.h`. The `WOLFSSL_ESPWROOM32` define enables ESP32-WROOM-32 hardware crypto and RNG support by default. Currently wolfSSL supports RNG, AES, SHA and RSA primitive at the crypt layer. The example projects including TLS server/client, wolfCrypt test and benchmark can be found at `/examples/protocols` directory in ESP-IDF after deploying files.

4.5 SSL Inspection (Sniffer)

Beginning with the wolfSSL 1.5.0 release, wolfSSL has included a build option allowing it to be built with SSL Sniffer (SSL Inspection) functionality. This means that you can collect SSL traffic packets and with the correct key file, are able to decrypt them as well. The ability to “inspect” SSL traffic can be useful for several reasons, some of which include:

- Analyzing Network Problems
- Detecting network misuse by internal and external users
- Monitoring network usage and data in motion
- Debugging client/server communications

To enable sniffer support, build wolfSSL with the `--enable-sniffer` option on *nix or use the **vcproj** files on Windows. You will need to have **pcap** installed on *nix or **WinPcap** on Windows. The main sniffer functions which can be found in `sniffer.h` are listed below with a short description of each:

- `ssl_SetPrivateKey` - Sets the private key for a specific server and port.
- `ssl_SetNamedPrivateKey` - Sets the private key for a specific server, port and domain name.
- `ssl_DecodePacket` - Passes in a TCP/IP packet for decoding.
- `ssl_Trace` - Enables / Disables debug tracing to the traceFile.
- `ssl_InitSniffer` - Initialize the overall sniffer.
- `ssl_FreeSniffer` - Free the overall sniffer.
- `ssl_EnableRecovery` - Enables option to attempt to pick up decoding of SSL traffic in the case of lost packets.
- `ssl_GetSessionStats` - Obtains memory usage for the sniffer sessions.

To look at wolfSSL's sniffer support and see a complete example, please see the `snifftest` app in the `sslSniffer/sslSnifferTest` folder from the wolfSSL download.

Keep in mind that because the encryption keys are setup in the SSL Handshake, the handshake needs to be decoded by the sniffer in order for future application data to be decoded. For example, if you are using “snifftest” with the wolfSSL example echoserver and echoclient, the snifftest application must be started before the handshake begins between the server and client.

The sniffer can only decode streams encrypted with the following algorithms: AES-CBC, DES3-CBC, ARC4, HC-128, RABBIT, Camellia-CBC, and IDEA. If ECDHE or DHE key agreement is used the stream cannot be sniffed; only RSA or ECDH key-exchange is supported.

Watch callbacks with wolfSSL sniffer can be turned on with `WOLFSSL_SNIFFER_WATCH`. With the sniffer watch feature compiled in, the function `ssl_SetWatchKeyCallback()` can be used to set a custom callback. The callback is then used to inspect the certificate chain, error value, and digest of the certificate sent from the peer. If a non 0 value is returned from the callback then an error state is set when processing the peer's certificate. Additional supporting functions for the watch callbacks are:

- `ssl_SetWatchKeyCtx`: Sets a custom user context that gets passed to the watch callback.
- `ssl_SetWatchKey_buffer`: Loads a new DER format key into server session.
- `ssl_SetWatchKey_file`: File version of `ssl_SetWatchKey_buffer`.

Statistics collecting with the sniffer can be compiled in with defining the macro `WOLFSSL_SNIFFER_STATS`. The statistics are kept in a `SSLStats` structure and are copied to an applications `SSLStats` structure by a call to `ssl_ReadStatistics`. Additional API to use with sniffer statistics is `ssl_ResetStatistics` (resets the collection of statistics) and `ssl_ReadResetStatistics` (reads the current statistic values and then resets the internal state). The following is the current statistics kept when turned on:

- `sslStandardConns`
- `sslClientAuthConns`
- `sslResumedConns`
- `sslEphemeralMisses`
- `sslResumeMisses`

- sslCiphersUnsupported
- sslKeysUnmatched
- sslKeyFails
- sslDecodeFails
- sslAlerts
- sslDecryptedBytes
- sslEncryptedBytes
- sslEncryptedPackets
- sslDecryptedPackets
- sslKeyMatches
- sslEncryptedConns

4.6 Compression

wolfSSL supports data compression with the **zlib** library. The `./configure` build system detects the presence of this library, but if you're building in some other way define the constant `HAVE_LIBZ` and include the path to `zlib.h` for your includes.

Compression is off by default for a given cipher. To turn it on, use the function `wolfSSL_set_compression()` before SSL connecting or accepting. Both the client and server must have compression turned on in order for compression to be used.

Keep in mind that while compressing data before sending decreases the actual size of the messages being sent and received, the amount of data saved by compression usually takes longer time to analyze than it does to send it raw on all but the slowest of networks.

4.7 Pre-Shared Keys

wolfSSL has support for these ciphers with static pre-shared keys:

- TLS_PSK_WITH_AES_256_CBC_SHA
- TLS_PSK_WITH_AES_128_CBC_SHA256
- TLS_PSK_WITH_AES_256_CBC_SHA384
- TLS_PSK_WITH_AES_128_CBC_SHA
- TLS_PSK_WITH_NULL_SHA256
- TLS_PSK_WITH_NULL_SHA384
- TLS_PSK_WITH_NULL_SHA
- TLS_PSK_WITH_AES_128_GCM_SHA256
- TLS_PSK_WITH_AES_256_GCM_SHA384
- TLS_PSK_WITH_AES_128_CCM
- TLS_PSK_WITH_AES_256_CCM
- TLS_PSK_WITH_AES_128_CCM_8
- TLS_PSK_WITH_AES_256_CCM_8
- TLS_PSK_WITH_CHACHA20_POLY1305

These suites are built into wolfSSL with `WOLFSSL_STATIC_PSK` on, all PSK suites can be turned off at build time with the constant `NO_PSK`. To only use these ciphers at runtime use the function `wolfSSL_CTX_set_cipher_list()` with the desired ciphersuite.

wolfSSL has support for ephemeral key PSK suites:

- ECDHE-PSK-AES128-CBC-SHA256
- ECDHE-PSK-NULL-SHA256
- ECDHE-PSK-CHACHA20-POLY1305
- DHE-PSK-CHACHA20-POLY1305
- DHE-PSK-AES256-GCM-SHA384
- DHE-PSK-AES128-GCM-SHA256

- DHE-PSK-AES256-CBC-SHA384
- DHE-PSK-AES128-CBC-SHA256
- DHE-PSK-AES128-CBC-SHA256

On the client, use the function `wolfSSL_CTX_set_psk_client_callback()` to setup the callback. The client example in `<wolfSSL_Home>/examples/client/client.c` gives example usage for setting up the client identity and key, though the actual callback is implemented in `wolfssl/test.h`.

On the server side two additional calls are required:

- `wolfSSL_CTX_set_psk_server_callback()`
- `wolfSSL_CTX_use_psk_identity_hint()`

The server stores its identity hint to help the client with the 2nd call, in our server example that's "wolfssl server". An example server psk callback can also be found in `my_psk_server_cb()` in `wolfssl/test.h`.

wolfSSL supports identities and hints up to 128 octets and pre-shared keys up to 64 octets.

4.8 Client Authentication

Client authentication is a feature which enables the server to authenticate clients by requesting that the clients send a certificate to the server for authentication when they connect. Client authentication requires an X.509 client certificate from a CA (or self-signed if generated by you or someone other than a CA).

By default, wolfSSL validates all certificates that it receives - this includes both client and server. To set up client authentication, the server must load the list of trusted CA certificates to be used to verify the client certificate against:

```
wolfSSL_CTX_load_verify_locations(ctx, caCert, 0);
```

To turn on client verification and control its behavior, the `wolfSSL_CTX_set_verify()` function is used. In the following example, `SSL_VERIFY_PEER` turns on a certificate request from the server to the client. `SSL_VERIFY_FAIL_IF_NO_PEER_CERT` instructs the server to fail if the client does not present a certificate to validate on the server side. Other options to `wolfSSL_CTX_set_verify()` include `SSL_VERIFY_NONE` and `SSL_VERIFY_CLIENT_ONCE`.

```
wolfSSL_CTX_set_verify(ctx, SSL_VERIFY_PEER | ((usePskPlus)?
                        SSL_VERIFY_FAIL_EXCEPT_PSK :
                        SSL_VERIFY_FAIL_IF_NO_PEER_CERT), 0);
```

An example of client authentication can be found in the example server (`server.c`) included in the wolfSSL download (`/examples/server/server.c`).

4.9 Server Name Indication

SNI is useful when a server hosts multiple 'virtual' servers at a single underlying network address. It may be desirable for clients to provide the name of the server which it is contacting. To enable SNI with wolfSSL you can simply do:

```
./configure --enable-sni
```

Using SNI on the client side requires an additional function call, which should be one of the following functions:

- `wolfSSL_CTX_UseSNI()`
- `wolfSSL_UseSNI()`

`wolfSSL_CTX_UseSNI()` is most recommended when the client contacts the same server multiple times. Setting the SNI extension at the context level will enable the SNI usage in all SSL objects created from that same context from the moment of the call forward.

`wolfSSL_UseSNI()` will enable SNI usage for one SSL object only, so it is recommended to use this function when the server name changes between sessions.

On the server side one of the same function calls is required. Since the wolfSSL server doesn't host multiple 'virtual' servers, the SNI usage is useful when the termination of the connection is desired in the case of SNI mismatch. In this scenario, `wolfSSL_CTX_UseSNI()` will be more efficient, as the server will set it only once per context creating all subsequent SSL objects with SNI from that same context.

4.10 Handshake Modifications

4.10.1 Grouping Handshake Messages

wolfSSL has the ability to group handshake messages if the user desires. This can be done at the context level with `wolfSSL_CTX_set_group_messages(ctx)`; or at the SSL object level with `wolfSSL_set_group_messages(ssl)`.

4.11 Truncated HMAC

Currently defined TLS cipher suites use the HMAC to authenticate record-layer communications. In TLS, the entire output of the hash function is used as the MAC tag. However, it may be desirable in constrained environments to save bandwidth by truncating the output of the hash function to 80 bits when forming MAC tags. To enable the usage of Truncated HMAC at wolfSSL you can simply do:

```
./configure --enable-truncatedhmac
```

Using Truncated HMAC on the client side requires an additional function call, which should be one of the following functions:

- `wolfSSL_CTX_UseTruncatedHMAC()`
- `wolfSSL_UseTruncatedHMAC()`

`wolfSSL_CTX_UseTruncatedHMAC()` is most recommended when the client would like to enable Truncated HMAC for all sessions. Setting the Truncated HMAC extension at context level will enable it in all SSL objects created from that same context from the moment of the call forward.

`wolfSSL_UseTruncatedHMAC()` will enable it for one SSL object only, so it's recommended to use this function when there is no need for Truncated HMAC on all sessions.

On the server side no call is required. The server will automatically attend to the client's request for Truncated HMAC.

All TLS extensions can also be enabled with:

```
./configure --enable-tlsx
```

4.12 User Crypto Module

User Crypto Module allows for a user to plug in custom crypto that they want used during supported operations (Currently RSA operations are supported). An example of a module is located in the directory `root_wolfssl/wolfcrypt/user-crypto/` using IPP libraries. Examples of the configure option when building wolfSSL to use a crypto module is as follows:

```
./configure --with-user-crypto
```

or

```
./configure --with-user-crypto=/dir/to
```

When creating a user crypto module that performs RSA operations, it is mandatory that there is a header file for RSA called `user_rsa.h`. For all user crypto operations it is mandatory that the users library be called `libusercrypto`. These are the names that wolfSSL autoconf tools will be looking for when linking and using a user crypto module. In the example provided with wolfSSL, the header file `user_rsa.h` can be found in the directory `wolfcrypt/user-crypto/include/` and the library once created is located in the directory `wolfcrypt/user-crypto/lib/`. For a list of required API look at the header file provided.

To build the example, after having installed IPP libraries, the following commands from the root wolfSSL directory should be ran.

```
cd wolfcrypt/user-crypto/  
./autogen.sh  
./configure  
make  
sudo make install
```

The included example in wolfSSL requires the use of IPP, which will need to be installed before the project can be built. Though even if not having IPP libraries to build the example it is intended to provide users with an example of file name choice and API interface. Once having made and installed both the library `libusercrypto` and header files, making wolfSSL use the crypto module does not require any extra steps. Simply using the configure flag `--with-user-crypto` will map all function calls from the typical wolfSSL crypto to the user crypto module.

Memory allocations, if using wolfSSL's `XMALLOC`, should be tagged with `DYNAMIC_TYPE_USER_CRYPT0`. Allowing for analyzing memory allocations used by the module.

User crypto modules **cannot** be used in conjunction with the wolfSSL configure options `fast-rsa` and/or `fips`. `fips` requires that specific, certified code be used and `fast-rsa` makes use of the example user crypto module to perform RSA operations.

4.13 Timing-Resistance in wolfSSL

wolfSSL provides the function "ConstantCompare" which guarantees constant time when doing comparison operations that could potentially leak timing information. This API is used at both the TLS and crypto level in wolfSSL to deter against timing based, side-channel attacks.

The wolfSSL ECC implementation has the define `ECC_TIMING_RESISTANT` to enable timing-resistance in the ECC algorithm. Similarly the define `TFM_TIMING_RESISTANT` is provided in the fast math libraries for RSA algorithm timing-resistance. The function `exptmod` uses the timing resistant Montgomery ladder.

See also: `--disable-harden`

Timing resistance and cache resistance defines enabled with `--enable-harden`:

- `WOLFSSL_SP_CACHE_RESISTANT`: Enables logic to mask the address used.
- `WC_RSA_BLINDING`: Enables blinding mode, to prevent timing attacks.
- `ECC_TIMING_RESISTANT`: ECC specific timing resistance.
- `TFM_TIMING_RESISTANT`: Fast math specific timing resistance.

4.14 Fixed ABI

wolfSSL provides a fixed Application Binary Interface (ABI) for a subset of the Application Programming Interface (API). Starting with wolfSSL v4.3.0, the following functions will be compatible across all future releases of wolfSSL:

- wolfSSL_Init()
- wolfTLSv1_2_client_method()
- wolfTLSv1_3_client_method()
- wolfSSL_CTX_new()
- wolfSSL_CTX_load_verify_locations()
- wolfSSL_new()
- wolfSSL_set_fd()
- wolfSSL_connect()
- wolfSSL_read()
- wolfSSL_write()
- wolfSSL_get_error()
- wolfSSL_shutdown()
- wolfSSL_free()
- wolfSSL_CTX_free()
- wolfSSL_check_domain_name()
- wolfSSL_UseALPN()
- wolfSSL_CTX_SetMinVersion()
- wolfSSL_pending()
- wolfSSL_set_timeout()
- wolfSSL_CTX_set_timeout()
- wolfSSL_get_session()
- wolfSSL_set_session()
- wolfSSL_flush_sessions()
- wolfSSL_CTX_set_session_cache_mode()
- wolfSSL_get_sessionID()
- wolfSSL_UseSNI()
- wolfSSL_CTX_UseSNI()
- wc_ecc_init_ex()
- wc_ecc_make_key_ex()
- wc_ecc_sign_hash()
- wc_ecc_free()
- wolfSSL_SetDevId()
- wolfSSL_CTX_SetDevId()
- wolfSSL_CTX_SetEccSignCb()
- wolfSSL_CTX_use_certificate_chain_file()
- wolfSSL_CTX_use_certificate_file()
- wolfSSL_use_certificate_chain_file()
- wolfSSL_use_certificate_file()
- wolfSSL_CTX_use_PrivateKey_file()
- wolfSSL_use_PrivateKey_file()
- wolfSSL_X509_load_certificate_file()
- wolfSSL_get_peer_certificate()
- wolfSSL_X509_NAME_online()
- wolfSSL_X509_get_issuer_name()
- wolfSSL_X509_get_subject_name()
- wolfSSL_X509_get_next_altname()
- wolfSSL_X509_notBefore()
- wolfSSL_X509_notAfter()
- wc_ecc_key_new()
- wc_ecc_key_free()

5 Portability

5.1 Abstraction Layers

5.1.1 C Standard Library Abstraction Layer

wolfSSL (formerly CyaSSL) can be built without the C standard library to provide a higher level of portability and flexibility to developers. The user will have to map the functions they wish to use instead of the C standard ones.

5.1.1.1 Memory Use Most C programs use `malloc()` and `free()` for dynamic memory allocation. wolfSSL uses `XMALLOC()` and `XFREE()` instead. By default, these point to the C runtime versions. By defining `XMALLOC_USER`, the user can provide their own hooks. Each memory function takes two additional arguments over the standard ones, a heap hint, and an allocation type. The user is free to ignore these or use them in any way they like. You can find the wolfSSL memory functions in `wolfssl/wolfcrypt/types.h`.

wolfSSL also provides the ability to register memory override functions at runtime instead of compile time. `wolfssl/wolfcrypt/memory.h` is the header for this functionality and the user can call the following function to set up the memory functions:

```
int wolfSSL_SetAllocators(wolfSSL_Malloc_cb malloc_function,
                          wolfSSL_Free_cb free_function,
                          wolfSSL_Realloc_cb realloc_function);
```

See the header `wolfssl/wolfcrypt/memory.h` for the callback prototypes and `memory.c` for the implementation.

5.1.1.2 string.h wolfSSL uses several functions that behave like `string.h`'s `memcpy()`, `memset()`, and `memcmp()` amongst others. They are abstracted to `XMEMCPY()`, `XMEMSET()`, and `XMEMCMP()` respectively. And by default, they point to the C standard library versions. Defining `STRING_USER` allows the user to provide their own hooks in `types.h`. For example, by default `XMEMCPY()` is:

```
#define XMEMCPY(d,s,l)    memcpy((d),(s),(l))
```

After defining `STRING_USER` you could do:

```
#define XMEMCPY(d,s,l)    my_memcpy((d),(s),(l))
```

Or if you prefer to avoid macros:

```
external void* my_memcpy(void* d, const void* s, size_t n);
```

to set wolfSSL's abstraction layer to point to your version `my_memcpy()`.

5.1.1.3 math.h wolfSSL uses two functions that behave like `math.h`'s `pow()` `log()`. They are only required by Diffie-Hellman, so if you exclude DH from the build, then you don't have to provide your own. They are abstracted to `XPOW()` and `XLOG()` and found in `wolfcrypt/src/dh.c`.

5.1.1.4 File System Use By default, wolfSSL uses the system's file system for the purpose of loading keys and certificates. This can be turned off by defining `NO_FILESYSTEM`, see item V. If instead, you'd like to use a file system but not the system one, you can use the `XFILE()` layer in `ssl.c` to point the file system calls to the ones you'd like to use. See the example provided by the MICRIUM define.

5.1.2 Custom Input/Output Abstraction Layer

wolfSSL provides a custom I/O abstraction layer for those who wish to have higher control over I/O of their SSL connection or run SSL on top of a different transport medium other than TCP/IP.

The user will need to define two functions:

1. The network Send function
2. The network Receive function

These two functions are prototyped by `CallbackIORecv` and `CallbackIORecv` in `ssl.h`:

```
typedef int (*CallbackIORecv)(WOLFSSL *ssl, char *buf, int sz, void *ctx);
typedef int (*CallbackIOSend)(WOLFSSL *ssl, char *buf, int sz, void *ctx);
```

The user needs to register these functions per `WOLFSSL_CTX` with `wolfSSL_SetIORecv()` and `wolfSSL_SetIOSend()`. For example, in the default case, `CBIORcv()` and `CBIOSend()` are registered at the bottom of `io.c`:

```
void wolfSSL_SetIORecv(WOLFSSL_CTX *ctx, CallbackIORecv CBIORcv)
{
    ctx->CBIORcv = CBIORcv;
}
```

```
void wolfSSL_SetIOSend(WOLFSSL_CTX *ctx, CallbackIOSend CBIOSend)
{
    ctx->CBIOSend = CBIOSend;
}
```

The user can set a context per `WOLFSSL` object (session) with `wolfSSL_SetIOWriteCtx()` and `wolfSSL_SetIOReadCtx()`, as demonstrated at the bottom of `io.c`. For example, if the user is using memory buffers, the context may be a pointer to a structure describing where and how to access the memory buffers. The default case, with no user overrides, registers the socket as the context.

The `CBIORcv` and `CBIOSend` function pointers can be pointed to your custom I/O functions. The default `Send()` and `Receive()` functions, `EmbedSend()` and `EmbedReceive()`, located in `io.c`, can be used as templates and guides.

`WOLFSSL_USER_IO` can be defined to remove the automatic setting of the default I/O functions `EmbedSend()` and `EmbedReceive()`.

5.1.3 Operating System Abstraction Layer

The wolfSSL OS abstraction layer helps facilitate easier porting of wolfSSL to a user's operating system. The `wolfssl/wolfcrypt/settings.h` file contains settings which end up triggering the OS layer.

OS-specific defines are located in `wolfssl/wolfcrypt/types.h` for `wolfCrypt` and `wolfssl/internal.h` for `wolfSSL`.

5.2 Supported Operating Systems

One factor which defines wolfSSL is its ability to be easily ported to new platforms. As such, wolfSSL has support for a long list of operating systems out-of-the-box. Currently-supported operating systems include:

- Win32/64
- Linux
- Mac OS X
- Solaris
- ThreadX

- VxWorks
- FreeBSD
- NetBSD
- OpenBSD
- embedded Linux
- Yocto Linux
- OpenEmbedded
- WinCE
- Haiku
- OpenWRT
- iPhone (iOS)
- Android
- Nintendo Wii and Gamecube through DevKitPro
- QNX
- MontaVista
- NonStop
- TRON/ITRON/ μ ITRON
- Micrium's μ C/OS-III
- FreeRTOS
- SafeRTOS
- NXP/Freescale MQX
- Nucleus
- TinyOS
- HP/UX
- AIX
- ARC MQX
- TI-RTOS
- uTasker
- embOS
- INtime
- Mbed
- μ T-Kernel
- RIOT
- CMSIS-RTOS
- FROSTED
- Green Hills INTEGRITY
- Keil RTX
- TOPPERS
- PetaLinux
- Apache Mynewt

5.3 Supported Chipmakers

wolfSSL has support for chipsets including ARM, Intel, Motorola, mbed, Freescale, Microchip (PIC32), STMicro (STM32F2/F4), NXP, Analog Devices, Texas Instruments, AMD and more.

5.4 C# Wrapper

wolfSSL has limited support for use in C#. A Visual Studio project containing the port can be found in the directory `root_wolfSSL/wrapper/CSharp/`. After opening the Visual Studio project set the "Active solution configuration" and "Active solution platform" by clicking on BUILD->Configuration Manager... The supported "Active solution configuration"s are DLL Debug and DLL Release. The supported platforms are Win32 and x64.

Once having set the solution and platform the preprocessor flag HAVE_CSHARP will need to be added. This turns on the options used by the C# wrapper and used by the examples included.

To then build simply select build solution. This creates the wolfssl.dll, wolfSSL_CSharp.dll and examples. Examples can be ran by targeting them as an entry point and then running debug in Visual Studio.

Adding the created C# wrapper to C# projects can be done a couple of ways. One way is to install the created wolfssl.dll and wolfSSL_CSharp.dll into the directory C:/Windows/System/. This will allow projects that have:

```
using wolfSSL.CSharp
```

```
public some_class {  
  
    public static main(){  
        wolfssl.Init()  
        ...  
    }  
    ...  
}
```

to make calls to the wolfSSL C# wrapper. Another way is to create a Visual Studio project and have it reference the bundled C# wrapper solution in wolfSSL.

6 Callbacks

6.1 HandShake Callback

wolfSSL (formerly CyaSSL) has an extension that allows a HandShake Callback to be set for connect or accept. This can be useful in embedded systems for debugging support when another debugger isn't available and sniffing is impractical. To use wolfSSL HandShake Callbacks, use the extended functions, `wolfSSL_connect_ex()` and `wolfSSL_accept_ex()`:

```
int wolfSSL_connect_ex(WOLFSSL*, HandShakeCallback, TimeoutCallback,  
                      Timeval)  
int wolfSSL_accept_ex(WOLFSSL*, HandShakeCallback, TimeoutCallback,  
                     Timeval)
```

HandShakeCallback is defined as:

```
typedef int (*HandShakeCallback)(HandShakeInfo*);
```

HandShakeInfo is defined in wolfssl/callbacks.h (which should be added to a non-standard build):

```
typedef struct handShakeInfo_st {  
    char    cipherName[MAX_CIPHERNAME_SZ + 1]; /*negotiated name */  
    char    packetNames[MAX_PACKETS_HANDSHAKE][MAX_PACKETNAME_SZ+1];  
                                                /* SSL packet names */  
    int     numberPackets; /*actual # of packets */  
    int     negotiationError; /*cipher/parameter err */  
} HandShakeInfo;
```

No dynamic memory is used since the maximum number of SSL packets in a handshake exchange is known. Packet names can be accessed through packetNames[idx] up to numberPackets. The callback will be called whether or not a handshake error occurred. Example usage is also in the client example.

6.2 Timeout Callback

The same extensions used with wolfSSL Handshake Callbacks can be used for wolfSSL Timeout Callbacks as well. These extensions can be called with either, both, or neither callbacks (Handshake and/or Timeout). TimeoutCallback is defined as:

```
typedef int (*TimeoutCallback)(TimeoutInfo*);
```

Where TimeoutInfo looks like:

```
typedef struct timeoutInfo_st {
    char        timeoutName[MAX_TIMEOUT_NAME_SZ + 1]; /*timeout Name*/
    int         flags;                               /* for future use*/
    int         numberPackets;                       /*actual # of packets */
    PacketInfo  packets[MAX_PACKETS_HANDSHAKE]; /*list of packets */
    Timeval     timeoutValue;                       /*timer that caused it */
} TimeoutInfo;
```

Again, no dynamic memory is used for this structure since a maximum number of SSL packets is known for a handshake. Timeval is just a typedef for struct timeval.

PacketInfo is defined like this:

```
typedef struct packetInfo_st {
    char        packetName[MAX_PACKETNAME_SZ + 1]; /* SSL name */
    Timeval     timestamp;                       /* when it occurred */
    unsigned char value[MAX_VALUE_SZ];          /* if fits, it's here */
    unsigned char* bufferValue;                 /* otherwise here (non 0) */
    int         valueSz;                        /* sz of value or buffer */
} PacketInfo;
```

Here, dynamic memory may be used. If the SSL packet can fit in value then that's where it's placed. valueSz holds the length and bufferValue is 0. If the packet is too big for value, only **Certificate** packets should cause this, then the packet is placed in bufferValue. valueSz still holds the size.

If memory is allocated for a **Certificate** packet then it is reclaimed after the callback returns. The timeout is implemented using signals, specifically SIGALRM, and is thread safe. If a previous alarm is set of type ITIMER_REAL then it is reset, along with the correct handler, afterwards. The old timer will be time adjusted for any time wolfSSL spends processing. If an existing timer is shorter than the passed timer, the existing timer value is used. It is still reset afterwards. An existing timer that expires will be reset if has an interval associated with it. The callback will only be issued if a timeout occurs.

See the [client example](#) for usage.

6.3 User Atomic Record Layer Processing

wolfSSL provides Atomic Record Processing callbacks for users who wish to have more control over MAC/encrypt and decrypt/verify functionality during the SSL/TLS connection.

The user will need to define 2 functions:

1. MAC/encrypt callback function
2. Decrypt/verify callback function

These two functions are prototyped by CallbackMacEncrypt and CallbackDecryptVerify in ssl.h:

```
typedef int (*CallbackMacEncrypt)(WOLFSSL* ssl,
    unsigned char* macOut, const unsigned char* macIn,
    unsigned int macInSz, int macContent, int macVerify,
    unsigned char* encOut, const unsigned char* encIn,
```

```
unsigned int encSz,void* ctx);
```

```
typedef int (*CallbackDecryptVerify)(WOLFSSL* ssl,
    unsigned char* decOut, const unsigned char* decIn,
    unsigned int decSz, int content, int verify,
    unsigned int* padSz, void* ctx);
```

The user needs to write and register these functions per wolfSSL context (WOLFSSL_CTX) with `wolfSSL_CTX_SetMacEncryptCb()` and `wolfSSL_CTX_SetDecryptVerifyCb()`.

The user can set a context per WOLFSSL object (session) with `wolfSSL_SetMacEncryptCtx()` and `wolfSSL_SetDecryptVerifyCtx()`. This context may be a pointer to any user-specified context, which will then in turn be passed back to the MAC/encrypt and decrypt/verify callbacks through the `void* ctx` parameter.

1. Example callbacks can be found in `wolfssl/test.h`, under `myMacEncryptCb()` and `myDecryptVerifyCb()`. Usage can be seen in the wolfSSL example client (`examples/client/client.c`), when using the `-U` command line option.

To use Atomic Record Layer callbacks, wolfSSL needs to be compiled using the `--enable-atomicuser` configure option, or by defining the `ATOMIC_USER` preprocessor flag.

6.4 Public Key Callbacks

wolfSSL provides Public Key callbacks for users who wish to have more control over ECC sign/verify functionality as well as RSA sign/verify and encrypt/decrypt functionality during the SSL/TLS connection.

The user can optionally define 7 functions:

1. ECC sign callback
2. ECC verify callback
3. ECC shared secret callback
4. RSA sign callback
5. RSA verify callback
6. RSA encrypt callback
7. RSA decrypt callback

These two functions are prototyped by `CallbackEccSign`, `CallbackEccVerify`, `CallbackEccSharedSecret`, `CallbackRsaSign`, `CallbackRsaVerify`, `CallbackRsaEnc`, and `CallbackRsaDec` in `ssl.h`:

```
typedef int (*CallbackEccSign)(WOLFSSL* ssl, const unsigned
    char* in, unsigned int inSz, unsigned char* out,
    unsigned int* outSz, const unsigned char* keyDer,
    unsigned int keySz, void* ctx);
```

```
typedef int (*CallbackEccVerify)(WOLFSSL* ssl,
    const unsigned char* sig, unsigned int sigSz,
    const unsigned char* hash, unsigned int hashSz,
    const unsigned char* keyDer, unsigned int keySz,
    int* result, void* ctx);
```

```
typedef int (*CallbackEccSharedSecret)(WOLFSSL* ssl,
    struct ecc_key* otherKey,
    unsigned char* pubKeyDer, unsigned int* pubKeySz,
    unsigned char* out, unsigned int* outlen,
    int side, void* ctx);
```

```

typedef int (*CallbackRsaSign)(WOLFSSL* ssl,
    const unsigned char* in, unsigned int inSz,
    unsigned char* out, unsigned int* outSz,
    const unsigned char* keyDer, unsigned int keySz,
    void* ctx);

typedef int (*CallbackRsaVerify)(WOLFSSL* ssl,
    unsigned char* sig, unsigned int sigSz,
    unsigned char** out, const unsigned char* keyDer,
    unsigned int keySz, void* ctx);

typedef int (*CallbackRsaEnc)(WOLFSSL* ssl,
    const unsigned char* in, unsigned int inSz,
    Unsigned char* out, unsigned int* outSz,
    const unsigned char* keyDer,
    unsigned int keySz, void* ctx);

typedef int (*CallbackRsaDec)(WOLFSSL* ssl, unsigned char* in,
    unsigned int inSz, unsigned char** out,
    const unsigned char* keyDer, unsigned int keySz,
    void* ctx);

```

The user needs to write and register these functions per wolfSSL context (WOLFSSL_CTX) with:

- wolfSSL_CTX_SetEccSignCb()
- wolfSSL_CTX_SetEccVerifyCb()
- wolfSSL_CTX_SetEccSharedSecretCb()
- wolfSSL_CTX_SetRsaSignCb()
- wolfSSL_CTX_SetRsaVerifyCb()
- wolfSSL_CTX_SetRsaEncCb()
- wolfSSL_CTX_SetRsaDecCb()

The user can set a context per WOLFSSL object (session) with:

- wolfSSL_SetEccSignCtx()
- wolfSSL_SetEccVerifyCtx()
- wolfSSL_SetEccSharedSecretCtx()
- wolfSSL_SetRsaSignCtx()
- wolfSSL_SetRsaVerifyCtx()
- wolfSSL_SetRsaEncCtx()
- wolfSSL_SetRsaDecCtx()

These contexts may be pointers to any user-specified context, which will then in turn be passed back to the respective public key callback through the `void* ctx` parameter.

Example callbacks can be found in `wolfssl/test.h`, under `myEccSign()`, `myEccVerify()`, `myEccSharedSecret()`, `myRsaSign()`, `myRsaVerify()`, `myRsaEnc()`, and `myRsaDec()`. Usage can be seen in the wolfSSL example client (`examples/client/client.c`), when using the `-P` command line option.

To use Atomic Record Layer callbacks, wolfSSL needs to be compiled using the `--enable-pkcallbacks` configure option, or by defining the `HAVE_PK_CALLBACKS` preprocessor flag.

7 Keys and Certificates

For an introduction to X.509 certificates, as well as how they are used in SSL and TLS, please see Appendix A.

7.1 Supported Formats and Sizes

wolfSSL (formerly CyaSSL) has support for **PEM**, and **DER** formats for certificates and keys, as well as PKCS#8 private keys (with PKCS#5 or PKCS#12 encryption).

PEM, or “Privacy Enhanced Mail” is the most common format that certificates are issued in by certificate authorities. PEM files are Base64 encoded ASCII files which can include multiple server certificates, intermediate certificates, and private keys, and usually have a .pem, .crt, .cer, or .key file extension. Certificates inside PEM files are wrapped in the “-----BEGIN CERTIFICATE-----” and “-----END CERTIFICATE-----” statements.

DER, or “Distinguished Encoding Rules”, is a binary format of a certificate. DER file extensions can include .der and .cer, and cannot be viewed with a text editor.

An X.509 certificate is encoded using ASN.1 format. The DER format is the ASN.1 encoding. The PEM format is Base64 encoded and wrapped with a human readable header and footer. TLS send certificates in DER format.

7.2 Certificate Loading

Certificates are normally loaded using the file system (although loading from memory buffers is supported as well - see [No File System and using Certificates](#)).

7.2.1 Loading CA Certificates**

CA certificate files can be loaded using the `wolfSSL_CTX_load_verify_locations()` function:

```
int wolfSSL_CTX_load_verify_locations(WOLFSSL_CTX *ctx,
                                     const char *CAfile,
                                     const char *CApath);
```

CA loading can also parse multiple CA certificates per file using the above function by passing in a CAfile in PEM format with as many certs as possible. This makes initialization easier, and is useful when a client needs to load several root CAs at startup. This makes wolfSSL easier to port into tools that expect to be able to use a single file for CAs.

NOTE: If you have to load a chain of Roots and Intermediate certificates you must load them in the order of trust. Load ROOT CA first followed by Intermediate 1 followed by Intermediate 2 and so on. You may call `wolfSSL_CTX_load_verify_locations()` for each cert to be loaded or just once with a file containing the certs in order (Root at the top of the file and certs ordered by the chain of trust)

7.2.2 Loading Client or Server Certificates

Loading single client or server certificates can be done with the `wolfSSL_CTX_use_certificate_file()` function. If this function is used with a certificate chain, only the actual, or “bottom” certificate will be sent.

```
int wolfSSL_CTX_use_certificate_file(WOLFSSL_CTX *ctx,
                                    const char *CAfile,
                                    int type);
```

CAfile is the CA certificate file, and type is the format of the certificate - such as `SSL_FILETYPE_PEM`.

The server and client can send certificate chains using the `wolfSSL_CTX_use_certificate_chain_file()` function. The certificate chain file must be in PEM format and must be sorted starting with the subject's certificate (the actual client or server cert), followed by any intermediate certificates and ending (optionally) at the root "top" CA. The example server (`/examples/server/server.c`) uses this functionality.

NOTE: This is the exact reverse of the order necessary when loading a certificate chain for verification! Your file contents in this scenario would be Entity cert at the top of the file followed by the next cert up the chain and so on with Root CA at the bottom of the file.

```
int wolfSSL_CTX_use_certificate_chain_file(WOLFSSL_CTX *ctx,
                                          const char *file);
```

7.2.3 Loading Private Keys

Server private keys can be loaded using the `wolfSSL_CTX_use_PrivateKey_file()` function.

```
int wolfSSL_CTX_use_PrivateKey_file(WOLFSSL_CTX *ctx,
                                    const char *keyFile, int type);
```

keyFile is the private key file, and type is the format of the private key (e.g. `SSL_FILETYPE_PEM`).

7.2.4 Loading Trusted Peer Certificates

Loading a trusted peer certificate to use can be done with `wolfSSL_CTX_trust_peer_cert()`.

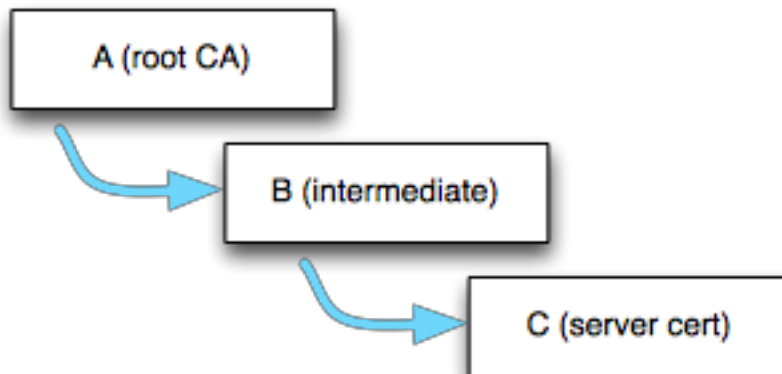

```
int wolfSSL_CTX_trust_peer_cert(WOLFSSL_CTX *ctx,
                                const char *trustCert, int type);
```

trustCert is the certificate file to load, and type is the format of the private key (i.e. `SSL_FILETYPE_PEM`).

7.3 Certificate Chain Verification

wolfSSL requires that only the top or "root" certificate in a chain to be loaded as a trusted certificate in order to verify a certificate chain. This means that if you have a certificate chain (A -> B -> C), where C is signed by B, and B is signed by A, wolfSSL only requires that certificate A be loaded as a trusted certificate in order to verify the entire chain (A->B->C).

For example, if a server certificate chain looks like:

The wolfSSL client should already have at least the root cert (A) loaded as a trusted root (with `wolfSSL_CTX_load_verify_locations()`). When the client receives the server cert chain, it uses the

signature of A to verify B, and if B has not been previously loaded into wolfSSL as a trusted root, B gets stored in wolfSSL's internal cert chain (wolfSSL just stores what is necessary to verify a certificate: common name hash, public key and key type, etc.). If B is valid, then it is used to verify C.

Following this model, as long as root cert "A" has been loaded as a trusted root into the wolfSSL server, the server certificate chain will still be able to be verified if the server sends (A->B->C), or (B->C). If the server just sends (C), and not the intermediate certificate, the chain will not be able to be verified unless the wolfSSL client has already loaded B as a trusted root.

7.4 Domain Name Check for Server Certificates

wolfSSL has an extension on the client that automatically checks the domain of the server certificate. In OpenSSL mode nearly a dozen function calls are needed to perform this. wolfSSL checks that the date of the certificate is in range, verifies the signature, and additionally verifies the domain if you call `wolfSSL_check_domain_name(WOLFSSL* ssl, const char* dn)` before calling `wolfSSL_connect()`. wolfSSL will match the X.509 issuer name of peer's server certificate against dn (the expected domain name). If the names match `wolfSSL_connect()` will proceed normally, however if there is a name mismatch, `wolfSSL_connect()` will return a fatal error and `wolfSSL_get_error()` will return `DOMAIN_NAME_MISMATCH`.

Checking the domain name of the certificate is an important step that verifies the server is actually who it claims to be. This extension is intended to ease the burden of performing the check.

7.5 No File System and using Certificates

Normally a file system is used to load private keys, certificates, and CAs. Since wolfSSL is sometimes used in environments without a full file system an extension to use memory buffers instead is provided. To use the extension define the constant `NO_FILESYSTEM` and the following functions will be made available:

- `int wolfSSL_CTX_load_verify_buffer(WOLFSSL_CTX* ctx, const unsigned char* in, long sz, int format);`
- `int wolfSSL_CTX_use_certificate_buffer(WOLFSSL_CTX* ctx, const unsigned char* in, long sz, int format);`
- `int wolfSSL_CTX_use_PrivateKey_buffer(WOLFSSL_CTX* ctx, const unsigned char* in, long sz, int format);`
- `int wolfSSL_CTX_use_certificate_chain_buffer(WOLFSSL_CTX* ctx, const unsigned char* in, long sz);`
- `int wolfSSL_CTX_trust_peer_buffer(WOLFSSL_CTX* ctx, const unsigned char* in, long sz, int format);`

Use these functions exactly like their counterparts that are named `*_file` instead of `*_buffer`. And instead of providing a filename provide a memory buffer. See API documentation for usage details.

7.5.1 Test Certificate and Key Buffers

wolfSSL has come bundled with test certificate and key files in the past. Now it also comes bundled with test certificate and key buffers for use in environments with no filesystem available. These buffers are available in `certs_test.h` when defining one or more of `USE_CERT_BUFFERS_1024`, `USE_CERT_BUFFERS_2048`, or `USE_CERT_BUFFERS_256`.

7.6 Serial Number Retrieval

The serial number of an X.509 certificate can be extracted from wolfSSL using `wolfSSL_X509_get_serial_number()`. The serial number can be of any length.

```
int wolfSSL_X509_get_serial_number(WOLFSSL_X509* x509,
    unsigned char* buffer, int* inOutSz)
```

buffer will be written to with at most *inOutSz bytes on input. After the call, if successful (return of 0), *inOutSz will hold the actual number of bytes written to buffer. A full example is included wolfssl/test.h.

7.7 RSA Key Generation

wolfSSL supports RSA key generation of varying lengths up to 4096 bits. Key generation is off by default but can be turned on during the ./configure process with --enable-keygen or by defining WOLFSSL_KEY_GEN in Windows or non-standard environments. Creating a key is easy, only requiring one function from rsa.h:

```
int MakeRsaKey(RsaKey* key, int size, long e, RNG* rng);
```

Where size is the length in bits and e is the public exponent, using 65537 is usually a good choice for e. The following from wolfcrypt/test/test.c gives an example creating an RSA key of 1024 bits:

```
RsaKey genKey;
RNG rng;
int ret;

InitRng(&rng);
InitRsaKey(&genKey, 0);

ret = MakeRsaKey(&genKey, 1024, 65537, &rng);
if (ret != 0)
    /* ret contains error */;
```

The RsaKey genKey can now be used like any other RsaKey. If you need to export the key, wolfSSL provides both DER and PEM formatting in asn.h. Always convert the key to DER format first, and then if you need PEM use the generic DerToPem() function like this:

```
byte der[4096];
int derSz = RsaKeyToDer(&genKey, der, sizeof(der));
if (derSz < 0)
    /* derSz contains error */;
```

The buffer der now holds a DER format of the key. To convert the DER buffer to PEM use the conversion function:

```
byte pem[4096];
int pemSz = DerToPem(der, derSz, pem, sizeof(pem),
    PRIVATEKEY_TYPE);
if (pemSz < 0)
    /* pemSz contains error */;
```

The last argument of DerToPem() takes a type parameter, usually either PRIVATEKEY_TYPE or CERT_TYPE. Now the buffer pem holds the PEM format of the key. Supported types are:

- CA_TYPE
- TRUSTED_PEER_TYPE
- CERT_TYPE
- CRL_TYPE
- DH_PARAM_TYPE
- DSA_PARAM_TYPE
- CERTREQ_TYPE
- DSA_TYPE

- DSA_PRIVATEKEY_TYPE
- ECC_TYPE
- ECC_PRIVATEKEY_TYPE
- RSA_TYPE
- PRIVATEKEY_TYPE
- ED25519_TYPE
- EDDSA_PRIVATEKEY_TYPE
- PUBLICKEY_TYPE
- ECC_PUBLICKEY_TYPE
- PKCS8_PRIVATEKEY_TYPE
- PKCS8_ENC_PRIVATEKEY_TYPE

7.7.1 RSA Key Generation Notes

The RSA private key contains the public key as well. The private key can be used as both a private and public key by wolfSSL as used in test.c. The private key and the public key (in the form of a certificate) is all that is typically needed for SSL.

A separate public key can be loaded into wolfSSL manually using the RsaPublicKeyDecode() function if need be. Additionally, the `wc_RsaKeyToPublicDer()` function can be used to export the public RSA key.

7.8 Certificate Generation

wolfSSL supports X.509 v3 certificate generation. Certificate generation is off by default but can be turned on during the `./configure` process with `--enable-certgen` or by defining `WOLFSSL_CERT_GEN` in Windows or non-standard environments.

Before a certificate can be generated the user needs to provide information about the subject of the certificate. This information is contained in a structure from `wolfssl/wolfcrypt/asn_public.h` named `Cert`:

```
/* for user to fill for certificate generation */
typedef struct Cert {
    int      version;           /* x509 version */
    byte     serial[CTC_SERIAL_SIZE]; /* serial number */
    int      sigType;           /*signature algo type */
    CertName issuer;            /* issuer info */
    int      daysValid;         /* validity days */
    int      selfSigned;        /* self signed flag */
    CertName subject;           /* subject info */
    int      isCA;              /*is this going to be a CA*/
    ...
} Cert;
```

Where `CertName` looks like:

```
typedef struct CertName {
char country[CTC_NAME_SIZE];
    char countryEnc;
    char state[CTC_NAME_SIZE];
    char stateEnc;
    char locality[CTC_NAME_SIZE];
    char localityEnc;
    char sur[CTC_NAME_SIZE];
    char surEnc;
```

```

    char org[CTC_NAME_SIZE];
    char orgEnc;
    char unit[CTC_NAME_SIZE];
    char unitEnc;
    char commonName[CTC_NAME_SIZE];
    char commonNameEnc;
    char email[CTC_NAME_SIZE]; /* !!!! email has to be last!!!! */
} CertName;

```

Before filling in the subject information an initialization function needs to be called like this:

```

Cert myCert;
InitCert(&myCert);

```

InitCert () sets defaults for some of the variables including setting the version to **3** (0x02), the serial number to **0** (randomly generated), the sigType to CTC_SHAwRSA, the daysValid to **500**, and selfSigned to **1** (TRUE). Supported signature types include:

- CTC_SHAwDSA
- CTC_MD2wRSA
- CTC_MD5wRSA
- CTC_SHAwRSA
- CTC_SHAwECDSA
- CTC_SHA256wRSA
- CTC_SHA256wECDSA
- CTC_SHA384wRSA
- CTC_SHA384wECDSA
- CTC_SHA512wRSA
- CTC_SHA512wECDSA

Now the user can initialize the subject information like this example from wolfcrypt/test/test.c:

```

strncpy(myCert.subject.country, "US", CTC_NAME_SIZE);
strncpy(myCert.subject.state, "OR", CTC_NAME_SIZE);
strncpy(myCert.subject.locality, "Portland", CTC_NAME_SIZE);
strncpy(myCert.subject.org, "yaSSL", CTC_NAME_SIZE);
strncpy(myCert.subject.unit, "Development", CTC_NAME_SIZE);
strncpy(myCert.subject.commonName, "www.wolfssl.com", CTC_NAME_SIZE);
strncpy(myCert.subject.email, "info@wolfssl.com", CTC_NAME_SIZE);

```

Then, a self-signed certificate can be generated using the variables genKey and rng from the above key generation example (of course any valid RsaKey or RNG can be used):

```

byte derCert[4096];

int certSz = MakeSelfCert(&myCert, derCert, sizeof(derCert), &key, &rng);
if (certSz < 0)
    /* certSz contains the error */;

```

The buffer derCert now contains a DER format of the certificate. If you need a PEM format of the certificate you can use the generic DerToPem () function and specify the type to be CERT_TYPE like this:

```

byte* pem;

int pemSz = DerToPem(derCert, certSz, pem, sizeof(pemCert), CERT_TYPE);
if (pemCertSz < 0)
    /* pemCertSz contains error */;

```

Supported types are:

- CA_TYPE
- TRUSTED_PEER_TYPE
- CERT_TYPE
- CRL_TYPE
- DH_PARAM_TYPE
- DSA_PARAM_TYPE
- CERTREQ_TYPE
- DSA_TYPE
- DSA_PRIVATEKEY_TYPE
- ECC_TYPE
- ECC_PRIVATEKEY_TYPE
- RSA_TYPE
- PRIVATEKEY_TYPE
- ED25519_TYPE
- EDDSA_PRIVATEKEY_TYPE
- PUBLICKEY_TYPE
- ECC_PUBLICKEY_TYPE
- PKCS8_PRIVATEKEY_TYPE
- PKCS8_ENC_PRIVATEKEY_TYPE

Now the buffer pemCert< holds the PEM format of the certificate.

If you wish to create a CA signed certificate then a couple of steps are required. After filling in the subject information as before, you'll need to set the issuer information from the CA certificate. This can be done with SetIssuer() like this:

```
ret = SetIssuer(&myCert, "ca-cert.pem");
if (ret < 0)
    /* ret contains error */;
```

Then you'll need to perform the two-step process of creating the certificate and then signing it (MakeSelfCert() does these both in one step). You'll need the private keys from both the issuer (caKey) and the subject (key). Please see the example in test.c for complete usage.

```
byte derCert[4096];

int certSz = MakeCert(&myCert, derCert, sizeof(derCert), &key, NULL, &rng);
if (certSz < 0);
    /*certSz contains the error*/;

certSz = SignCert(myCert.bodySz, myCert.sigType, derCert,
    sizeof(derCert), &caKey, NULL, &rng);
if (certSz < 0);
    /*certSz contains the error*/;
```

The buffer derCert now contains a DER format of the CA signed certificate. If you need a PEM format of the certificate please see the self signed example above. Note that MakeCert() and SignCert() provide function parameters for either an RSA or ECC key to be used. The above example uses an RSA key and passes NULL for the ECC key parameter.

7.9 Certificate Signing Request (CSR) Generation

wolfSSL supports X.509 v3 certificate signing request (CSR) generation. CSR generation is off by default but can be turned on during the ./configure process with --enable-certreq --enable-certgen or by defining WOLFSSL_CERT_GEN and WOLFSSL_CERT_REQ in Windows or non-standard environments.

Before a CSR can be generated the user needs to provide information about the subject of the certificate. This information is contained in a structure from `wolfssl/wolfcrypt/asn_public.h` named `Cert`:

For details on the `Cert` and `CertName` structures please reference [Certificate Generation](#) above.

Before filling in the subject information an initialization function needs to be called like this:

```
Cert request;
InitCert(&request);
```

`InitCert()` sets defaults for some of the variables including setting the version to **3** (0x02), the serial number to **0** (randomly generated), the `sigType` to `CTC_SHAwRSA`, the `daysValid` to **500**, and `selfSigned` to **1** (TRUE). Supported signature types include:

- `CTC_SHAwDSA`
- `CTC_MD2wRSA`
- `CTC_MD5wRSA`
- `CTC_SHAwRSA`
- `CTC_SHAwECDSA`
- `CTC_SHA256wRSA`
- `CTC_SHA256wECDSA`
- `CTC_SHA384wRSA`
- `CTC_SHA384wECDSA`
- `CTC_SHA512wRSA`
- `CTC_SHA512wECDSA`

Now the user can initialize the subject information like this example from https://github.com/wolfSSL/wolfssl-examples/blob/master/certgen/csr_example.c:

```
strncpy(req.subject.country, "US", CTC_NAME_SIZE);
strncpy(req.subject.state, "OR", CTC_NAME_SIZE);
strncpy(req.subject.locality, "Portland", CTC_NAME_SIZE);
strncpy(req.subject.org, "wolfSSL", CTC_NAME_SIZE);
strncpy(req.subject.unit, "Development", CTC_NAME_SIZE);
strncpy(req.subject.commonName, "www.wolfssl.com", CTC_NAME_SIZE);
strncpy(req.subject.email, "info@wolfssl.com", CTC_NAME_SIZE);
```

Then, a valid signed CSR can be generated using the variable `key` from the above key generation example (of course any valid ECC/RSA key or RNG can be used):

```
byte der[4096]; /* Store request in der format once made */
```

```
ret = wc_MakeCertReq(&request, der, sizeof(der), NULL, &key);
/* check ret value for error handling, <= 0 indicates a failure */
```

Next you will want to sign your request making it valid, use the `rng` variable from the above key generation example. (of course any valid ECC/RSA key or RNG can be used)

```
derSz = ret;
```

```
req.sigType = CTC_SHA256wECDSA;
ret = wc_SignCert(request.bodySz, request.sigType, der, sizeof(der), NULL, &key, &rng);
/* check ret value for error handling, <= 0 indicates a failure */
```

Lastly it is time to convert the CSR to PEM format for sending to a CA authority to use in issuing a certificate:

```
ret = wc_DerToPem(der, derSz, pem, sizeof(pem), CERTREQ_TYPE);
/* check ret value for error handling, <= 0 indicates a failure */
printf("%s", pem); /* or write to a file */
```

7.9.1 Limitations

There are fields that are mandatory in a certificate that are excluded in a CSR. There are other fields in a CSR that are also deemed “optional” that are otherwise mandatory when in a certificate. Because of this the wolfSSL certificate parsing engine, which strictly checks all certificate fields AND considers all fields mandatory, does not support consuming a CSR at this time. Therefore while CSR generation AND certificate generation from scratch are supported, wolfSSL does not support certificate generation FROM a CSR. Passing in a CSR to the wolfSSL parsing engine will return a failure at this time. Check back for updates once we support consuming a CSR for use in certificate generation!

See also: [Certificate Generation](#)

7.10 Convert to raw ECC key

With our recently added support for raw ECC key import comes the ability to convert an ECC key from PEM to DER. Use the following with the specified arguments to accomplish this:

```
EccKeyToDer(ecc_key*, byte* output, word32 inLen);
```

7.10.1 Example

```
#define FOURK_BUF 4096
byte der[FOURK_BUF];
ecc_key userB;

EccKeyToDer(&userB, der, FOURK_BUF);
```

8 Debugging

8.1 Debugging and Logging

wolfSSL (formerly CyaSSL) has support for debugging through log messages in environments where debugging is limited. To turn logging on use the function `wolfSSL_Debugging_ON()` and to turn it off use `wolfSSL_Debugging_OFF()`. In a normal build (release mode) these functions will have no effect. In a debug build, define `DEBUG_WOLFSSL` to ensure these functions are turned on.

As of wolfSSL 2.0, logging callback functions may be registered at runtime to provide more flexibility with how logging is done. The logging callback can be registered with the function `wolfSSL_SetLoggingCb()`:

```
int wolfSSL_SetLoggingCb(wolfSSL_Logging_cb log_function);

typedef void (*wolfSSL_Logging_cb)(const int logLevel,
                                   const char *const logMessage);
```

The log levels can be found in `wolfssl/wolfcrypt/logging.h`, and the implementation is located in `logging.c`. By default, wolfSSL logs to `stderr` with `fprintf`.

8.2 Error Codes

wolfSSL tries to provide informative error messages in order to help with debugging.

Each `wolfSSL_read()` and `wolfSSL_write()` call will return the number of bytes written upon success, 0 upon connection closure, and -1 for an error, just like `read()` and `write()`. In the event of an error you can use two calls to get more information about the error.

The function `wolfSSL_get_error()` will return the current error code. It takes the current WOLFSSL object, and `wolfSSL_read()` or `wolfSSL_write()` result value as an arguments and returns the corresponding error code.

```
int err = wolfSSL_get_error(ssl, result);
```

To get a more human-readable error code description, the `wolfSSL_ERR_error_string()` function can be used. It takes the return code from `wolfSSL_get_error` and a storage buffer as arguments, and places the corresponding error description into the storage buffer (errorString in the example below).

```
char errorString[80];  
wolfSSL_ERR_error_string(err, errorString);
```

If you are using non blocking sockets, you can test for errno EAGAIN/EWOULDBLOCK or more correctly you can test the specific error code for `SSL_ERROR_WANT_READ` or `SSL_ERROR_WANT_WRITE`.

For a list of wolfSSL and wolfCrypt error codes, please see Appendix C (Error Codes).

9 Library Design

9.1 Library Headers

With the release of wolfSSL 2.0.0 RC3, library header files are now located in the following locations:

- wolfSSL: `wolfssl/`
- wolfCrypt: `wolfssl/wolfcrypt/`
- wolfSSL OpenSSL Compatibility Layer: `wolfssl/openssl/`

When using the OpenSSL Compatibility layer (see [OpenSSL Compatibility](#)), the `/wolfssl/openssl/ssl.h` header is required to be included:

```
#include <wolfssl/openssl/ssl.h>
```

When using only the wolfSSL native API, only the `/wolfssl/ssl.h` header is required to be included:

```
#include <wolfssl/ssl.h>
```

9.2 Startup and Exit

All applications should call `wolfSSL_Init()` before using the library and call `wolfSSL_Cleanup()` at program termination. Currently these functions only initialize and free the shared mutex for the session cache in multi-user mode but in the future they may do more so it's always a good idea to use them.

9.3 Structure Usage

In addition to header file location changes, the release of wolfSSL 2.0.0 RC3 created a more visible distinction between the native wolfSSL API and the wolfSSL OpenSSL Compatibility Layer. With this distinction, the main SSL/TLS structures used by the native wolfSSL API have changed names. The new structures are as follows. The previous names are still used when using the OpenSSL Compatibility Layer (see [OpenSSL Compatibility](#)).

- WOLFSSL (previously SSL)
- WOLFSSL_CTX (previously SSL_CTX)
- WOLFSSL_METHOD (previously SSL_METHOD)
- WOLFSSL_SESSION (previously SSL_SESSION)
- WOLFSSL_X509 (previously X509)

- WOLFSSL_X509_NAME (previously X509_NAME)
- WOLFSSL_X509_CHAIN (previously X509_CHAIN)

9.4 Thread Safety

wolfSSL (formerly CyaSSL) is thread safe by design. Multiple threads can enter the library simultaneously without creating conflicts because wolfSSL avoids global data, static data, and the sharing of objects. The user must still take care to avoid potential problems in two areas.

1. A client may share an WOLFSSL object across multiple threads but access must be synchronized, i.e., trying to read/write at the same time from two different threads with the same SSL pointer is not supported.

wolfSSL could take a more aggressive (constrictive) stance and lock out other users when a function is entered that cannot be shared but this level of granularity seems counter-intuitive. All users (even single threaded ones) will pay for the locking and multi-thread ones won't be able to re-enter the library even if they aren't sharing objects across threads. This penalty seems much too high and wolfSSL leaves the responsibility of synchronizing shared objects in the hands of the user.

2. Besides sharing WOLFSSL pointers, users must also take care to completely initialize an WOLFSSL_CTX before passing the structure to `wolfSSL_new()`. The same WOLFSSL_CTX can create multiple WOLFSSL structs but the WOLFSSL_CTX is only read during `wolfSSL_new()` creation and any future (or simultaneous changes) to the WOLFSSL_CTX will not be reflected once the WOLFSSL object is created.

Again, multiple threads should synchronize writing access to a WOLFSSL_CTX and it is advised that a single thread initialize the WOLFSSL_CTX to avoid the synchronization and update problem described above.

9.5 Input and Output Buffers

wolfSSL now uses dynamic buffers for input and output. They default to 0 bytes and are controlled by the RECORD_SIZE define in `wolfssl/internal.h`. If an input record is received that is greater in size than the static buffer, then a dynamic buffer is temporarily used to handle the request and then freed. You can set the static buffer size up to the MAX_RECORD_SIZE which is 2^{16} or 16,384.

If you prefer the previous way that wolfSSL operated, with 16Kb static buffers that will never need dynamic memory, you can still get that option by defining LARGE_STATIC_BUFFERS.

If dynamic buffers are used and the user requests a `wolfSSL_write()` that is bigger than the buffer size, then a dynamic block up to MAX_RECORD_SIZE is used to send the data. Users wishing to only send the data in chunks of at most RECORD_SIZE size can do this by defining STATIC_CHUNKS_ONLY. This will cause wolfSSL to use I/O buffers which grow up to RECORD_SIZE, which is 128 bytes by default.

10 wolfCrypt Usage Reference

wolfCrypt is the cryptography library primarily used by wolfSSL. It is optimized for speed, small footprint, and portability. wolfSSL interchanges with other cryptography libraries as required.

Types used in the examples:

```
typedef unsigned char byte;
typedef unsigned int word32;
```

10.1 Hash Functions

10.1.1 MD4

NOTE: MD4 is outdated and considered insecure. Please consider using a different hashing function if possible.

To use MD4 include the MD4 header `wolfssl/wolfcrypt/md4.h`. The structure to use is `Md4`, which is a typedef. Before using, the hash initialization must be done with the `wc_InitMd4()` call. Use `wc_Md4Update()` to update the hash and `wc_Md4Final()` to retrieve the final hash.

```
byte md4sum[MD4_DIGEST_SIZE];
byte buffer[1024];
/* fill buffer with data to hash*/
```

```
Md4 md4;
wc_InitMd4(&md4);
```

```
wc_Md4Update(&md4, buffer, sizeof(buffer)); /*can be called again
                                             and again*/
```

```
wc_Md4Final(&md4, md4sum);
```

`md4sum` now contains the digest of the hashed data in buffer.

10.1.2 MD5

NOTE: MD5 is outdated and considered insecure. Please consider using a different hashing function if possible.

To use MD5 include the MD5 header `wolfssl/wolfcrypt/md5.h`. The structure to use is `Md5`, which is a typedef. Before using, the hash initialization must be done with the `wc_InitMd5()` call. Use `wc_Md5Update()` to update the hash and `wc_Md5Final()` to retrieve the final hash

```
byte md5sum[MD5_DIGEST_SIZE];
byte buffer[1024];
/*fill buffer with data to hash*/
```

```
Md5 md5;
wc_InitMd5(&md5);
```

```
wc_Md5Update(&md5, buffer, sizeof(buffer)); /*can be called again
                                             and again*/
```

```
wc_Md5Final(&md5, md5sum);
```

`md5sum` now contains the digest of the hashed data in buffer.

10.1.3 SHA / SHA-224 / SHA-256 / SHA-384 / SHA-512

To use SHA include the SHA header `wolfssl/wolfcrypt/sha.h`. The structure to use is `Sha`, which is a typedef. Before using, the hash initialization must be done with the `wc_InitSha()` call. Use `wc_ShaUpdate()` to update the hash and `wc_ShaFinal()` to retrieve the final hash:

```
byte shaSum[SHA_DIGEST_SIZE];
byte buffer[1024];
/*fill buffer with data to hash*/
```

```
Sha sha;
wc_InitSha(&sha);
```

```

wc_ShaUpdate(&sha, buffer, sizeof(buffer)); /*can be called again
                                              and again*/

```

```

wc_ShaFinal(&sha, shaSum);

```

shaSum now contains the digest of the hashed data in buffer.

To use either SHA-224, SHA-256, SHA-384, or SHA-512, follow the same steps as shown above, but use either the `wolfssl/wolfcrypt/sha256.h` or `wolfssl/wolfcrypt/sha512.h` (for both SHA-384 and SHA-512). The SHA-256, SHA-384, and SHA-512 functions are named similarly to the SHA functions.

For **SHA-224**, the functions `wc_InitSha224()`, `wc_Sha224Update()`, and `wc_Sha224Final()` will be used with the structure `Sha224`.

For **SHA-256**, the functions `wc_InitSha256()`, `wc_Sha256Update()`, and `wc_Sha256Final()` will be used with the structure `Sha256`.

For **SHA-384**, the functions `InitSha384()`, `wc_Sha384Update()`, and `wc_Sha384Final()` will be used with the structure `Sha384`.

For **SHA-512**, the functions `wc_InitSha512()`, `Sha512Update()`, and `Sha512Final()` will be used with the structure `Sha512`.

10.1.4 BLAKE2b

To use BLAKE2b (a SHA-3 finalist) include the BLAKE2b header `wolfssl/wolfcrypt/blake2.h`. The structure to use is `Blake2b`, which is a typedef. Before using, the hash initialization must be done with the `wc_InitBlake2b()` call. Use `wc_Blake2bUpdate()` to update the hash and `wc_Blake2bFinal()` to retrieve the final hash:

```

byte digest[64];
byte input[64]; /*fill input with data to hash*/

```

```

Blake2b b2b;
wc_InitBlake2b(&b2b, 64);

```

```

wc_Blake2bUpdate(&b2b, input, sizeof(input));
wc_Blake2bFinal(&b2b, digest, 64);

```

The second parameter to `wc_InitBlake2b()` should be the final digest size. `digest` now contains the digest of the hashed data in buffer.

Example usage can be found in the wolfCrypt test application (`wolfcrypt/test/test.c`), inside the `blake2b_test()` function.

10.1.5 RIPEMD-160

To use RIPEMD-160, include the header `wolfssl/wolfcrypt/ripemd.h`. The structure to use is `RipeMd`, which is a typedef. Before using, the hash initialization must be done with the `wc_InitRipeMd()` call. Use `wc_RipeMdUpdate()` to update the hash and `wc_RipeMdFinal()` to retrieve the final hash

```

byte ripeMdSum[RIPEMD_DIGEST_SIZE];
byte buffer[1024];
/*fill buffer with data to hash*/

```

```

RipeMd ripemd;
wc_InitRipeMd(&ripemd);

```

```

wc_RipeMdUpdate(&ripemd, buffer, sizeof(buffer)); /*can be called
                                                    again and again*/
wc_RipeMdFinal(&ripemd, ripeMdSum);
ripeMdSum now contains the digest of the hashed data in buffer.

```

10.2 Keyed Hash Functions

10.2.1 HMAC

wolfCrypt currently provides HMAC for message digest needs. The structure Hmac is found in the header wolfssl/wolfcrypt/hmac.h. HMAC initialization is done with `wc_HmacSetKey()`. 5 different types are supported with HMAC: MD5, SHA, SHA-256, SHA-384, and SHA-512. Here's an example with SHA-256.

```

Hmac    hmac;
byte    key[24];           /*fill key with keying material*/
byte    buffer[2048];      /*fill buffer with data to digest*/
byte    hmacDigest[SHA256_DIGEST_SIZE];

wc_HmacSetKey(&hmac, SHA256, key, sizeof(key));
wc_HmacUpdate(&hmac, buffer, sizeof(buffer));
wc_HmacFinal(&hmac, hmacDigest);

```

hmacDigest now contains the digest of the hashed data in buffer.

10.2.2 GMAC

wolfCrypt also provides GMAC for message digest needs. The structure Gmac is found in the header wolfssl/wolfcrypt/aes.h, as it is an application AES-GCM. GMAC initialization is done with `wc_GmacSetKey()`.

```

Gmac    gmac;
byte    key[16];           /*fill key with keying material*/
byte    iv[12];            /*fill iv with an initialization vector*/
byte    buffer[2048];      /*fill buffer with data to digest*/
byte    gmacDigest[16];

wc_GmacSetKey(&gmac, key, sizeof(key));
wc_GmacUpdate(&gmac, iv, sizeof(iv), buffer, sizeof(buffer),
gmacDigest, sizeof(gmacDigest));

```

gmacDigest now contains the digest of the hashed data in buffer.

10.2.3 Poly1305

wolfCrypt also provides Poly1305 for message digest needs. The structure Poly1305 is found in the header wolfssl/wolfcrypt/poly1305.h. Poly1305 initialization is done with `wc_Poly1305SetKey()`. The process of setting a key in Poly1305 should be done again, with a new key, when next using Poly1305 after `wc_Poly1305Final()` has been called.

```

Poly1305    pmac;
byte        key[32];           /*fill key with keying material*/
byte        buffer[2048];      /*fill buffer with data to digest*/
byte        pmacDigest[16];

```

```

wc_Poly1305SetKey(&pmac, key, sizeof(key));
wc_Poly1305Update(&pmac, buffer, sizeof(buffer));
wc_Poly1305Final(&pmac, pmacDigest);

```

pmacDigest now contains the digest of the hashed data in buffer.

10.3 Block Ciphers

10.3.1 AES

wolfCrypt provides support for AES with key sizes of 16 bytes (128 bits), 24 bytes (192 bits), or 32 bytes (256 bits). Supported AES modes include CBC, CTR, GCM, and CCM-8.

CBC mode is supported for both encryption and decryption and is provided through the `wc_AesSetKey()`, `wc_AesCbcEncrypt()` and `wc_AesCbcDecrypt()` functions. Please include the header `wolfssl/wolfcrypt/aes.h` to use AES. AES has a block size of 16 bytes and the IV should also be 16 bytes. Function usage is usually as follows:

```

Aes enc;
Aes dec;

const byte key[] = { /*some 24 byte key*/ };
const byte iv[] = { /*some 16 byte iv*/ };

byte plain[32]; /*an increment of 16, fill with data*/
byte cipher[32];

/*encrypt*/
wc_AesSetKey(&enc, key, sizeof(key), iv, AES_ENCRYPTION);
wc_AesCbcEncrypt(&enc, cipher, plain, sizeof(plain));
cipher now contains the ciphertext from the plain text.

/*decrypt*/
wc_AesSetKey(&dec, key, sizeof(key), iv, AES_DECRYPTION);
wc_AesCbcDecrypt(&dec, plain, cipher, sizeof(cipher));
plain now contains the original plaintext from the ciphertext.

```

wolfCrypt also supports CTR (Counter), GCM (Galois/Counter), and CCM-8 (Counter with CBC-MAC) modes of operation for AES. When using these modes, like CBC, include the `wolfssl/wolfcrypt/aes.h` header.

GCM mode is available for both encryption and decryption through the `wc_AesGcmSetKey()`, `wc_AesGcmEncrypt()`, and `wc_AesGcmDecrypt()` functions. For a usage example, see the `aesgcm_test()` function in `<wolfssl_root>/wolfcrypt/test/test.c`.

CCM-8 mode is supported for both encryption and decryption through the `wc_AesCcmSetKey()`, `wc_AesCcmEncrypt()`, and `wc_AesCcmDecrypt()` functions. For a usage example, see the `aesccm_test()` function in `<wolfssl_root>/wolfcrypt/test/test.c`.

CTR mode is available for both encryption and decryption through the `wc_AesCtrEncrypt()` function. The encrypt and decrypt actions are identical so the same function is used for both. For a usage example, see the function `aes_test()` in file `wolfcrypt/test/test.c`.

10.3.1.1 DES and 3DES wolfCrypt provides support for DES and 3DES (Des3 since 3 is an invalid leading C identifier). To use these include the header `wolfssl/wolfcrypt/des.h`. The structures you can use are `Des` and `Des3`. Initialization is done through `wc_Des_SetKey()` or `wc_Des3_SetKey()`. CBC encryption/decryption is provided through `wc_Des_CbcEncrypt()` / `wc_Des_CbcDecrypt()` and

`wc_Des3_CbcEncrypt()` / `wc_Des3_CbcDecrypt()`. Des has a key size of 8 bytes (24 for 3DES) and the block size is 8 bytes, so only pass increments of 8 bytes to encrypt/decrypt functions. If your data isn't in a block size increment you'll need to add padding to make sure it is. Each `SetKey()` also takes an IV (an initialization vector that is the same size as the key size). Usage is usually like the following:

```
Des3 enc;
Des3 dec;

const byte key[] = { /*some 24 byte key*/ };
const byte iv[] = { /*some 24 byte iv*/ };

byte plain[24]; /*an increment of 8, fill with data*/
byte cipher[24];

/*encrypt*/
wc_Des3_SetKey(&enc, key, iv, DES_ENCRYPTION);
wc_Des3_CbcEncrypt(&enc, cipher, plain, sizeof(plain));
cipher now contains the ciphertext from the plain text.

/*decrypt*/
wc_Des3_SetKey(&dec, key, iv, DES_DECRYPTION);
wc_Des3_CbcDecrypt(&dec, plain, cipher, sizeof(cipher));
plain now contains the original plaintext from the ciphertext.
```

10.3.1.2 Camellia wolfCrypt provides support for the Camellia block cipher. To use Camellia include the header `wolfssl/wolfcrypt/camellia.h`. The structure you can use is called `Camellia`. Initialization is done through `wc_CamelliaSetKey()`. CBC encryption/decryption is provided through `wc_CamelliaCbcEncrypt()` and `wc_CamelliaCbcDecrypt()` while direct encryption/decryption is provided through `wc_CamelliaEncryptDirect()` and `wc_CamelliaDecryptDirect()`.

For usage examples please see the `camellia_test()` function in `<wolfssl_root>/wolfcrypt/test/test.c`.

10.4 Stream Ciphers

10.4.1 ARC4

NOTE: ARC4 is outdated and considered insecure. Please consider using a different stream cipher.

The most common stream cipher used on the Internet is ARC4. wolfCrypt supports it through the header `wolfssl/wolfcrypt/arc4.h`. Usage is simpler than block ciphers because there is no block size and the key length can be any length. The following is a typical usage of ARC4.

```
Arc4 enc;
Arc4 dec;

const byte key[] = { /*some key any length*/ };

byte plain[27]; /*no size restriction, fill with data*/
byte cipher[27];

/*encrypt*/
wc_Arc4SetKey(&enc, key, sizeof(key));
wc_Arc4Process(&enc, cipher, plain, sizeof(plain));
cipher now contains the ciphertext from the plain text.
```

```
/*decrypt*/
wc_Arc4SetKey(&dec, key, sizeof(key));
wc_Arc4Process(&dec, plain, cipher, sizeof(cipher));
plain now contains the original plaintext from the ciphertext.
```

10.4.2 RABBIT

A newer stream cipher gaining popularity is RABBIT. This stream cipher can be used through wolfCrypt by including the header `wolfssl/wolfcrypt/rabbit.h`. RABBIT is very fast compared to ARC4, but has key constraints of 16 bytes (128 bits) and an optional IV of 8 bytes (64 bits). Otherwise usage is exactly like ARC4:

```
Rabbit enc;
Rabbit dec;

const byte key[] = { /*some key 16 bytes*/ };
const byte iv[] = { /*some iv 8 bytes*/ };

byte plain[27]; /*no size restriction, fill with data*/
byte cipher[27];

/*encrypt*/
wc_RabbitSetKey(&enc, key, iv); /*iv can be a NULL pointer*/
wc_RabbitProcess(&enc, cipher, plain, sizeof(plain));
cipher now contains the ciphertext from the plain text.

/*decrypt*/
wc_RabbitSetKey(&dec, key, iv);
wc_RabbitProcess(&dec, plain, cipher, sizeof(cipher));
plain now contains the original plaintext from the ciphertext.
```

10.4.3 HC-128

Another stream cipher in current use is HC-128, which is even faster than RABBIT (about 5 times faster than ARC4). To use it with wolfCrypt, please include the header `wolfssl/wolfcrypt/hc128.h`. HC-128 also uses 16-byte keys (128 bits) but uses 16-byte IVs (128 bits) unlike RABBIT.

```
HC128 enc;
HC128 dec;

const byte key[] = { /*some key 16 bytes*/ };
const byte iv[] = { /*some iv 16 bytes*/ };

byte plain[37]; /*no size restriction, fill with data*/
byte cipher[37];

/*encrypt*/
wc_Hc128_SetKey(&enc, key, iv); /*iv can be a NULL pointer*/
wc_Hc128_Process(&enc, cipher, plain, sizeof(plain));
cipher now contains the ciphertext from the plain text.

/*decrypt*/
wc_Hc128_SetKey(&dec, key, iv);
wc_Hc128_Process(&dec, plain, cipher, sizeof(cipher));
```

plain now contains the original plaintext from the ciphertext.

10.4.4 ChaCha

ChaCha with 20 rounds is slightly faster than ARC4 while maintaining a high level of security. To use it with wolfCrypt, please include the header `wolfssl/wolfcrypt/chacha.h`. ChaCha typically uses 32 byte keys (256 bit) but can also use 16 byte keys (128 bits).

```
CHACHA enc;  
CHACHA dec;
```

```
const byte key[] = { /*some key 32 bytes*/ };  
const byte iv[] = { /*some iv 12 bytes*/ };
```

```
byte plain[37]; /*no size restriction, fill with data*/  
byte cipher[37];
```

```
/*encrypt*/  
wc_Chacha_SetKey(&enc, key, keySz);  
wc_Chacha_SetIV(&enc, iv, counter); /*counter is the start block  
                                     counter is usually set as 0*/  
wc_Chacha_Process(&enc, cipher, plain, sizeof(plain));
```

cipher now contains the ciphertext from the plain text.

```
/*decrypt*/  
wc_Chacha_SetKey(&enc, key, keySz);  
wc_Chacha_SetIV(&enc, iv, counter);  
wc_Chacha_Process(&enc, plain, cipher, sizeof(cipher));
```

plain now contains the original plaintext from the ciphertext.

`wc_Chacha_SetKey` only needs to be set once but for each packet of information sent `wc_Chacha_SetIV()` must be called with a new iv (nonce). Counter is set as an argument to allow for partially decrypting/encrypting information by starting at a different block when performing the encrypt/decrypt process, but in most cases is set to 0. **ChaCha should not be used without a mac algorithm (e.g. Poly1305, hmac).**

10.5 Public Key Cryptography

10.5.1 RSA

wolfCrypt provides support for RSA through the header `wolfssl/wolfcrypt/rsa.h`. There are two types of RSA keys, public and private. A public key allows anyone to encrypt something that only the holder of the private key can decrypt. It also allows the private key holder to sign something and anyone with a public key can verify that only the private key holder actually signed it. Usage is usually like the following:

```
RsaKey rsaPublicKey;
```

```
byte publicKeyBuffer[] = { /*holds the raw data from the key, maybe  
                           from a file like RsaPublicKey.der*/ };  
word32 idx = 0; /*where to start reading into the buffer*/
```

```
RsaPublicKeyDecode(publicKeyBuffer, &idx, &rsaPublicKey, sizeof(publicKeyBuffer));
```

```
byte in[] = { /*plain text to encrypt*/ };
```

```
byte out[128];
RNG rng;
```

```
wc_InitRng(&rng);
```

```
word32 outLen = RsaPublicEncrypt(in, sizeof(in), out, sizeof(out), &rsaPublicKey, &rng);
```

Now out holds the ciphertext from the plain text in. `wc_RsaPublicEncrypt()` will return the length in bytes written to out or a negative number in case of an error. `wc_RsaPublicEncrypt()` needs a RNG (Random Number Generator) for the padding used by the encryptor and it must be initialized before it can be used. To make sure that the output buffer is large enough to pass you can first call `wc_RsaEncryptSize()` which will return the number of bytes that a successful call to `wc_RsaPublicEncrypt()` will write.

In the event of an error, a negative return from `wc_RsaPublicEncrypt()`, or `wc_RsaPublicKeyDecode()` for that matter, you can call `wc_ErrorString()` to get a string describing the error that occurred.

```
void wc_ErrorString(int error, char* buffer);
```

Make sure that buffer is at least MAX_ERROR_SZ bytes (80).

Now to decrypt out:

```
RsaKey rsaPrivateKey;
```

```
byte privateKeyBuffer[] = { /*hold the raw data from the key, maybe
                           from a file like RsaPrivateKey.der*/ };
word32 idx = 0;           /*where to start reading into the buffer*/
```

```
wc_RsaPrivateKeyDecode(privateKeyBuffer, &idx, &rsaPrivateKey,
                      sizeof(privateKeyBuffer));
```

```
byte plain[128];
word32 plainSz = wc_RsaPrivateKeyDecrypt(out, outLen, plain,
                                         sizeof(plain), &rsaPrivateKey);
```

Now plain will hold plainSz bytes or an error code. For complete examples of each type in wolfCrypt please see the file `wolfcrypt/test/test.c`. Note that the `wc_RsaPrivateKeyDecode` function only accepts keys in raw DER format.

10.5.2 DH (Diffie-Hellman)

wolfCrypt provides support for Diffie-Hellman through the header `wolfssl/wolfcrypt/dh.h`. The Diffie-Hellman key exchange algorithm allows two parties to establish a shared secret key. Usage is usually similar to the following example, where **sideA** and **sideB** designate the two parties.

In the following example, `dhPublicKey` contains the Diffie-Hellman public parameters signed by a Certificate Authority (or self-signed). `privA` holds the generated private key for sideA, `pubA` holds the generated public key for sideA, and `agreeA` holds the mutual key that both sides have agreed on.

```
DhKey    dhPublicKey;
word32 idx = 0; /*where to start reading into the
                publicKeyBuffer*/
word32 pubASz, pubBSz, agreeASz;
byte    tmp[1024];
RNG     rng;

byte privA[128];
```

```

byte pubA[128];
byte agreeA[128];

wc_InitDhKey(&dhPublicKey);

byte publicKeyBuffer[] = { /*holds the raw data from the public key
                           parameters, maybe from a file like
                           dh1024.der*/ }
wc_DhKeyDecode(tmp, &idx, &dhPublicKey, publicKeyBuffer);
wc_InitRng(&rng); /*Initialize random number generator*/
wc_DhGenerateKeyPair() will generate a public and private DH key based on the initial public pa-
rameters in dhPublicKey.
wc_DhGenerateKeyPair(&dhPublicKey, &rng, privA, &privASz,
                    pubA, &pubASz);

```

After sideB sends their public key (pubB) to sideA, sideA can then generate the mutually-agreed key(agreeA) using the `wc_DhAgree()` function.

```

wc_DhAgree(&dhPublicKey, agreeA, &agreeASz, privA, privASz,
          pubB, pubBSz);

```

Now, agreeA holds sideA's mutually-generated key (of size agreeASz bytes). The same process will have been done on sideB.

For a complete example of Diffie-Hellman in wolfCrypt, see the file `wolfcrypt/test/test.c`.

10.5.3 EDH (Ephemeral Diffie-Hellman)

A wolfSSL server can do Ephemeral Diffie-Hellman. No build changes are needed to add this feature, though an application will have to register the ephemeral group parameters on the server side to enable the EDH cipher suites. A new API can be used to do this:

```

int wolfSSL_SetTmpDH(WOLFSSL* ssl, unsigned char* p,
                    int pSz, unsigned char* g, int gSz);

```

The example server and echoserver use this function from `SetDH()`.

10.5.4 DSA (Digital Signature Algorithm)

wolfCrypt provides support for DSA and DSS through the header `wolfssl/wolfcrypt/dsa.h`. DSA allows for the creation of a digital signature based on a given data hash. DSA uses the SHA hash algorithm to generate a hash of a block of data, then signs that hash using the signer's private key. Standard usage is similar to the following.

We first declare our DSA key structure (key), initialize our initial message (message) to be signed, and initialize our DSA key buffer (dsaKeyBuffer).

```

DsaKey key;
Byte message[] = { /*message data to sign*/ }
byte dsaKeyBuffer[] = { /*holds the raw data from the DSA key,
                       maybe from a file like dsa512.der*/ }

```

We then declare our SHA structure (sha), random number generator (rng), array to store our SHA hash (hash), array to store our signature (signature), idx (to mark where to start reading in our dsaKeyBuffer), and an int (answer) to hold our return value after verification.

```

Sha    sha;
RNG    rng;

```

```

byte    hash[SHA_DIGEST_SIZE];
byte    signature[40];
word32  idx = 0;
int     answer;

```

Set up and create the SHA hash. For more information on wolfCrypt's SHA algorithm, see [SHA / SHA-224 / SHA-256 / SHA-384 / SHA-512](#). The SHA hash of message is stored in the variable hash.

```

wc_InitSha(&sha);
wc_ShaUpdate(&sha, message, sizeof(message));
wc_ShaFinal(&sha, hash);

```

Initialize the DSA key structure, populate the structure key value, and initialize the random number generator (rng).

```

wc_InitDsaKey(&key);
wc_DsaPrivateKeyDecode(dsaKeyBuffer, &idx, &key,
                      sizeof(dsaKeyBuffer));
wc_InitRng(&rng);

```

The `wc_DsaSign()` function creates a signature (signature) using the DSA private key, hash value, and random number generator.

```

wc_DsaSign(hash, signature, &key, &rng);

```

To verify the signature, use `wc_DsaVerify()`. If verification is successful, answer will be equal to "1". Once finished, free the DSA key structure using `wc_FreeDsaKey()`.

```

wc_DsaVerify(hash, signature, &key, &answer);
wc_FreeDsaKey(&key);

```

11 SSL Tutorial

11.1 Introduction

The wolfSSL (formerly CyaSSL) embedded SSL library can easily be integrated into your existing application or device to provide enhanced communication security through the addition of SSL and TLS. wolfSSL has been targeted at embedded and RTOS environments, and as such, offers a minimal footprint while maintaining excellent performance. Minimum build sizes for wolfSSL range between 20-100kB depending on the selected build options and platform being used.

The goal of this tutorial is to walk through the integration of SSL and TLS into a simple application. Hopefully the process of going through this tutorial will also lead to a better understanding of SSL in general. This tutorial uses wolfSSL in conjunction with simple echoserver and echoclient examples to keep things as simple as possible while still demonstrating the general procedure of adding SSL support to an application. The echoserver and echoclient examples have been taken from the popular book titled [Unix Network Programming, Volume 1, 3rd Edition](#) by Richard Stevens, Bill Fenner, and Andrew Rudoff.

This tutorial assumes that the reader is comfortable with editing and compiling C code using the GNU GCC compiler as well as familiar with the concepts of public key encryption. Please note that access to the Unix Network Programming book is not required for this tutorial.

11.1.1 Examples Used in this Tutorial

- echoclient - Figure 5.4, Page 124
- echoserver - Figure 5.12, Page 139

11.2 Quick Summary of SSL/TLS

TLS (Transport Layer Security) and **SSL** (Secure Sockets Layer) are cryptographic protocols that allow for secure communication across a number of different transport protocols. The primary transport protocol used is TCP/IP. The most recent version of SSL/TLS is TLS 1.3. wolfSSL supports SSL 3.0, TLS 1.0, 1.1, 1.2, 1.3 in addition to DTLS 1.0 and 1.2.

SSL and TLS sit between the Transport and Application layers of the OSI model, where any number of protocols (including TCP/IP, Bluetooth, etc.) may act as the underlying transport medium. Application protocols are layered on top of SSL and can include protocols such as HTTP, FTP, and SMTP. A diagram of how SSL fits into the OSI model, as well as a simple diagram of the SSL handshake process can be found in Appendix A.

11.3 Getting the Source Code

All of the source code used in this tutorial can be downloaded from the wolfSSL website, specifically from the following location. The download contains both the original and completed source code for both the echoserver and echoclient used in this tutorial. Specific contents are listed below the link.

<https://www.wolfssl.com/documentation/ssl-tutorial-2.3.zip>

The downloaded ZIP file has the following structure:

```
/finished_src
    /echoclient (Completed echoclient code)
    /echoserver (Completed echoserver code)
    /include    (Modified unp.h)
    /lib        (Library functions)
/original_src
    /echoclient (Starting echoclient code)
    /echoserver (Starting echoserver code)
    /include    (Modified unp.h)
    /lib        (Library functions)
README
```

11.4 Base Example Modifications

This tutorial, and the source code that accompanies it, have been designed to be as portable as possible across platforms. Because of this, and because we want to focus on how to add SSL and TLS into an application, the base examples have been kept as simple as possible. Several modifications have been made to the examples taken from Unix Network Programming in order to either remove unnecessary complexity or increase the range of platforms supported. If you believe there is something we could do to increase the portability of this tutorial, please let us know at support@wolfssl.com.

The following is a list of modifications that were made to the original echoserver and echoclient examples found in the above listed book.

11.4.1 Modifications to the echoserver (tcpserv04.c)

- Removed call to the Fork() function because fork() is not supported by Windows. The result of this is an echoserver which only accepts one client simultaneously. Along with this removal, Signal handling was removed.
- Moved str_echo() function from str_echo.c file into tcpserv04.c file
- Added a printf statement to view the client address and the port we have connected through:

```
printf("Connection from %s, port %d\n",
      inet_ntop(AF_INET, &cliaddr.sin_addr, buff, sizeof(buff)),
      ntohs(cliaddr.sin_port));
```

- Added a call to `setsockopt()` after creating the listening socket to eliminate the “Address already in use” bind error.
- Minor adjustments to clean up newer compiler warnings

11.4.2 Modifications to the echoclient (tcpcli01.c)

- Moved `str_cli()` function from `str_cli.c` file into `tcpcli01.c` file
- Minor adjustments to clean up newer compiler warnings

11.4.3 Modifications to unp.h header

- This header was simplified to contain only what is needed for this example.

Please note that in these source code examples, certain functions will be capitalized. For example, `Fputs()` and `Writen()`. The authors of *Unix Network Programming* have written custom wrapper functions for normal functions in order to cleanly handle error checking. For a more thorough explanation of this, please see **Section 1.4** (page 11) in the *Unix Network Programming* book.

11.5 Building and Installing wolfSSL

Before we begin, download the example code (echoserver and echoclient) from the [Getting the Source Code](#) section, above. This section will explain how to download, configure, and install the wolfSSL embedded SSL library on your system.

You will need to download and install the most recent version of wolfSSL from the [wolfSSL download page](#).

For a full list of available build options, see the [Building wolfSSL](#) guide. wolfSSL was written with portability in mind, and should generally be easy to build on most systems. If you have difficulty building wolfSSL, please feel free to ask for support on the [wolfSSL product support forums](#).

When building wolfSSL on Linux, *BSD, OS X, Solaris, or other *nix like systems, you can use the autoconf system. For Windows-specific instructions, please refer to the [Building wolfSSL](#) section of the wolfSSL Manual. To configure and build wolfSSL, run the following two commands from the terminal. Any desired build options may be appended to `./configure` (ex: `./configure --enable-opensslextra`):

```
./configure
make
```

To install wolfSSL, run:

```
sudo make install
```

This will install wolfSSL headers into `/usr/local/include/wolfssl` and the wolfSSL libraries into `/usr/local/lib` on your system. To test the build, run the testsuite application from the wolfSSL root directory:

```
./testsuite/testsuite.test
```

A set of tests will be run on wolfCrypt and wolfSSL to verify it has been installed correctly. After a successful run of the testsuite application, you should see output similar to the following:

```
MD5      test passed!
SHA      test passed!
```

```

SHA-224 test passed!
SHA-256 test passed!
SHA-384 test passed!
SHA-512 test passed!
HMAC-MD5 test passed!
HMAC-SHA test passed!
HMAC-SHA224 test passed!
HMAC-SHA256 test passed!
HMAC-SHA384 test passed!
HMAC-SHA512 test passed!
GMAC test passed!
Chacha test passed!
POLY1305 test passed!
ChaCha20-Poly1305 AEAD test passed!
AES test passed!
AES-GCM test passed!
RANDOM test passed!
RSA test passed!
DH test passed!
ECC test passed!
SSL version is TLSv1.2
SSL cipher suite is TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384
SSL version is TLSv1.2
SSL cipher suite is TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384
Client message: hello wolfssl!
Server response: I hear you fa shizzle!
sending server shutdown command: quit!
client sent quit command: shutting down!
ciphers = DHE-RSA-AES128-SHA:DHE-RSA-AES256-SHA:ECDHE-RSA-AES128-SHA:ECDHE-

N0Xq9c

```

All tests passed!

Now that wolfSSL has been installed, we can begin modifying the example code to add SSL functionality. We will first begin by adding SSL to the echoclient and subsequently move on to the echoserver.

11.6 Initial Compilation

To compile and run the example echoclient and echoserver code from the SSL Tutorial source bundle, you can use the included Makefiles. Change directory (cd) to either the echoclient or echoserver directory and run:

`make`

This will compile the example code and produce an executable named either echoserver or echoclient

depending on which one is being built. The GCC command which is used in the Makefile can be seen below. If you want to build one of the examples without using the supplied Makefile, change directory to the example directory and replace `tcpccli01.c` (echoclient) or `tcpserve04.c` (echoserver) in the following command with correct source file for the example:

```
gcc -o echoserver ../lib/*.c tcpserve04.c -I ../include
```

This will compile the current example into an executable, creating either an “echoserver” or “echoclient” application. To run one of the examples after it has been compiled, change your current directory to the desired example directory and start the application. For example, to start the echoserver use:

```
./echoserver
```

You may open a second terminal window to test the echoclient on your local host and you will need to supply the IP address of the server when starting the application, which in our case will be 127.0.0.1. Change your current directory to the “echoclient” directory and run the following command. Note that the echoserver must already be running:

```
./echoclient 127.0.0.1
```

Once you have both the echoserver and echoclient running, the echoserver should echo back any input that it receives from the echoclient. To exit either the echoserver or echoclient, use `Ctrl + C` to quit the application. Currently, the data being echoed back and forth between these two examples is being sent in the clear - easily allowing anyone with a little bit of skill to inject themselves in between the client and server and listen to your communication.

11.7 Libraries

The wolfSSL library, once compiled, is named `libwolfssl`, and unless otherwise configured the wolfSSL build and install process creates only a shared library under the following directory. Both shared and static libraries may be enabled or disabled by using the appropriate build options:

```
/usr/local/lib
```

The first step we need to do is link the wolfSSL library to our example applications. Modifying the GCC command (using the echoserver as an example), gives us the following new command. Since wolfSSL installs header files and libraries in standard locations, the compiler should be able to find them without explicit instructions (using `-l` or `-L`). Note that by using `-lwolfssl` the compiler will automatically choose the correct type of library (static or shared):

```
gcc -o echoserver ../lib/*.c tcpserve04.c -I ../include -lm -lwolfssl
```

11.8 Headers

The first thing we will need to do is include the wolfSSL native API header in both the client and the server. In the `tcpccli01.c` file for the client and the `tcpserve04.c` file for the server add the following line near the top:

```
#include <wolfssl/ssl.h>
```

11.9 Startup/Shutdown

Before we can use wolfSSL in our code, we need to initialize the library and the `WOLFSSL_CTX`. wolfSSL is initialized by calling `wolfSSL_Init()`. This must be done first before anything else can be done with the library.

The `WOLFSSL_CTX` structure (wolfSSL Context) contains global values for each SSL connection, including certificate information. A single `WOLFSSL_CTX` can be used with any number of `WOLFSSL` objects created. This allows us to load certain information, such as a list of trusted CA certificates only once.

To create a new WOLFSSL_CTX, use `wolfSSL_CTX_new()`. This function requires an argument which defines the SSL or TLS protocol for the client or server to use. There are several options for selecting the desired protocol. wolfSSL currently supports SSL 3.0, TLS 1.0, TLS 1.1, TLS 1.2, DTLS 1.0, and DTLS 1.2. Each of these protocols have a corresponding function that can be used as an argument to `wolfSSL_CTX_new()`. The possible client and server protocol options are shown below. SSL 2.0 is not supported by wolfSSL because it has been insecure for several years.

EchoClient:

- `wolfSSLv3_client_method()`; - SSL 3.0
- `wolfTLSv1_client_method()`; - TLS 1.0
- `wolfTLSv1_1_client_method()`; - TLS 1.1
- `wolfTLSv1_2_client_method()`; - TLS 1.2
- `wolfSSLv23_client_method()`; - Use highest version possible from SSLv3 - TLS 1.2
- `wolfDTLSv1_client_method()`; - DTLS 1.0
- `wolfDTLSv1_2_client_method_ex()`; - DTLS 1.2

EchoServer:

- `wolfSSLv3_server_method()`; - SSLv3
- `wolfTLSv1_server_method()`; - TLSv1
- `wolfTLSv1_1_server_method()`; - TLSv1.1
- `wolfTLSv1_2_server_method()`; - TLSv1.2
- `wolfSSLv23_server_method()`; - Allow clients to connect with TLSv1+
- `wolfDTLSv1_server_method()`; - DTLS
- `wolfDTLSv1_2_server_method()`; - DTLS 1.2

We need to load our CA (Certificate Authority) certificate into the WOLFSSL_CTX so that the when the echoclient connects to the echoserver, it is able to verify the server's identity. To load the CA certificates into the WOLFSSL_CTX, use `wolfSSL_CTX_load_verify_locations()`. This function requires three arguments: a WOLFSSL_CTX pointer, a certificate file, and a path value. The path value points to a directory which should contain CA certificates in PEM format. When looking up certificates, wolfSSL will look at the certificate file value before looking in the path location. In this case, we don't need to specify a certificate path because we will specify one CA file - as such we use the value 0 for the path argument. The `wolfSSL_CTX_load_verify_locations` function returns either `SSL_SUCCESS` or `SSL_FAILURE`:

```
wolfSSL_CTX_load_verify_locations(WOLFSSL_CTX* ctx, const char* file, const char* path)
```

Putting these things together (library initialization, protocol selection, and CA certificate), we have the following. Here, we choose to use TLS 1.2:

EchoClient:

```
WOLFSSL_CTX* ctx;

wolfSSL_Init(); /* Initialize wolfSSL */

/* Create the WOLFSSL_CTX */
if ( (ctx = wolfSSL_CTX_new(wolfTLSv1_2_client_method())) == NULL){
    fprintf(stderr, "wolfSSL_CTX_new error.\n");
    exit(EXIT_FAILURE);
}

/* Load CA certificates into WOLFSSL_CTX */
if (wolfSSL_CTX_load_verify_locations(ctx, "../certs/ca-cert.pem", 0) !=
    SSL_SUCCESS) {
    fprintf(stderr, "Error loading ../certs/ca-cert.pem, please check
        the file.\n");
}
```

```
    exit(EXIT_FAILURE);
}
```

EchoServer:

When loading certificates into the WOLFSSL_CTX, the server certificate and key file should be loaded in addition to the CA certificate. This will allow the server to send the client its certificate for identification verification:

```
WOLFSSL_CTX* ctx;

wolfSSL_Init(); /* Initialize wolfSSL */

/* Create the WOLFSSL_CTX */
if ( (ctx = wolfSSL_CTX_new(wolfTLSv1_2_server_method())) == NULL){
    fprintf(stderr, "wolfSSL_CTX_new error.\n");
    exit(EXIT_FAILURE);
}

/* Load CA certificates into CYASSL_CTX */
if (wolfSSL_CTX_load_verify_locations(ctx, "../certs/ca-cert.pem", 0) !=
    SSL_SUCCESS) {
    fprintf(stderr, "Error loading ../certs/ca-cert.pem, "
        "please check the file.\n");
    exit(EXIT_FAILURE);
}

/* Load server certificates into WOLFSSL_CTX */
if (wolfSSL_CTX_use_certificate_file(ctx, "../certs/server-cert.pem",
    SSL_FILETYPE_PEM) != SSL_SUCCESS){
    fprintf(stderr, "Error loading ../certs/server-cert.pem, please
        check the file.\n");
    exit(EXIT_FAILURE);
}

/* Load keys */
if (wolfSSL_CTX_use_PrivateKey_file(ctx, "../certs/server-key.pem",
    SSL_FILETYPE_PEM) != SSL_SUCCESS){
    fprintf(stderr, "Error loading ../certs/server-key.pem, please check
        the file.\n");
    exit(EXIT_FAILURE);
}
```

The code shown above should be added to the beginning of tcpcli01.c and tcpserv04.c, after both the variable definitions and the check that the user has started the client with an IP address (client). A version of the finished code is included in the SSL tutorial ZIP file for reference.

Now that wolfSSL and the WOLFSSL_CTX have been initialized, make sure that the WOLFSSL_CTX object and the wolfSSL library are freed when the application is completely done using SSL/TLS. In both the client and the server, the following two lines should be placed at the end of the main() function (in the client right before the call to exit()):

```
wolfSSL_CTX_free(ctx);
wolfSSL_Cleanup();
```

11.10 WOLFSSL Object

11.10.1 EchoClient

A WOLFSSL object needs to be created after each TCP Connect and the socket file descriptor needs to be associated with the session. In the echoclient example, we will do this after the call to `Connect()`, shown below:

```
/* Connect to socket file descriptor */
Connect(sockfd, (SA *) &servaddr, sizeof(servaddr));
```

Directly after connecting, create a new WOLFSSL object using the `wolfSSL_new()` function. This function returns a pointer to the WOLFSSL object if successful or NULL in the case of failure. We can then associate the socket file descriptor (`sockfd`) with the new WOLFSSL object (`ssl`):

```
/* Create WOLFSSL object */
WOLFSSL* ssl;

if( (ssl = wolfSSL_new(ctx)) == NULL) {
    fprintf(stderr, "wolfSSL_new error.\n");
    exit(EXIT_FAILURE);
}

wolfSSL_set_fd(ssl, sockfd);
```

One thing to notice here is that we haven't made a call to the `wolfSSL_connect()` function. `wolfSSL_connect()` initiates the SSL/TLS handshake with the server, and is called during `wolfSSL_read()` if it hadn't been called previously. In our case, we don't explicitly call `wolfSSL_connect()`, as we let our first `wolfSSL_read()` do it for us.

11.10.2 EchoServer

At the end of the for loop in the main method, insert the WOLFSSL object and associate the socket file descriptor (`connfd`) with the WOLFSSL object (`ssl`), just as with the client:

```
/* Create WOLFSSL object */
WOLFSSL* ssl;

if ( (ssl = wolfSSL_new(ctx)) == NULL) {
    fprintf(stderr, "wolfSSL_new error.\n");
    exit(EXIT_FAILURE);
}

wolfSSL_set_fd(ssl, connfd);
```

A WOLFSSL object needs to be created after each TCP Connect and the socket file descriptor needs to be associated with the session.

Create a new WOLFSSL object using the `wolfSSL_new()` function. This function returns a pointer to the WOLFSSL object if successful or NULL in the case of failure. We can then associate the socket file descriptor (`sockfd`) with the new WOLFSSL object (`ssl`):

```
/* Create WOLFSSL object */
WOLFSSL* ssl;

if( (ssl = wolfSSL_new(ctx)) == NULL) {
    fprintf(stderr, "wolfSSL_new error.\n");
    exit(EXIT_FAILURE);
}
```

```
wolfSSL_set_fd(ssl, sockfd);
```

11.11 Sending/Receiving Data

11.11.1 EchoClient

The next step is to begin sending data securely. Take note that in the echoclient example, the `main()` function hands off the sending and receiving work to `str_cli()`. The `str_cli()` function is where our function replacements will be made. First we need access to our WOLFSSL object in the `str_cli()` function, so we add another argument and pass the `ssl` variable to `str_cli()`. Because the WOLFSSL object is now going to be used inside of the `str_cli()` function, we remove the `sockfd` parameter. The new `str_cli()` function signature after this modification is shown below:

```
void str_cli(FILE *fp, WOLFSSL* ssl)
```

In the `main()` function, the new argument (`ssl`) is passed to `str_cli()`:

```
str_cli(stdin, ssl);
```

Inside the `str_cli()` function, `Writen()` and `Readline()` are replaced with calls to `wolfSSL_write()` and `wolfSSL_read()` functions, and the WOLFSSL object (`ssl`) is used instead of the original file descriptor (`sockfd`). The new `str_cli()` function is shown below. Notice that we now need to check if our calls to `wolfSSL_write` and `wolfSSL_read` were successful.

The authors of the Unix Programming book wrote error checking into their `Writen()` function which we must make up for after it has been replaced. We add a new `int` variable, `n`, to monitor the return value of `wolfSSL_read` and before printing out the contents of the buffer, `recvline`, the end of our read data is marked with a `\0`:

```
void
str_cli(FILE *fp, WOLFSSL* ssl)
{
    char    sendline[MAXLINE], recvline[MAXLINE];
    int     n = 0;

    while (Fgets(sendline, MAXLINE, fp) != NULL) {

        if(wolfSSL_write(ssl, sendline, strlen(sendline)) !=
            strlen(sendline)){
            err_sys("wolfSSL_write failed");
        }

        if ((n = wolfSSL_read(ssl, recvline, MAXLINE)) <= 0)
            err_quit("wolfSSL_read error");

        recvline[n] = '\0';
        Fputs(recvline, stdout);
    }
}
```

The last thing to do is free the WOLFSSL object when we are completely done with it. In the `main()` function, right before the line to free the WOLFSSL_CTX, call to `wolfSSL_free()`:

```
str_cli(stdin, ssl);
```

```
wolfSSL_free(ssl);          /* Free WOLFSSL object */
```

```
wolfSSL_CTX_free(ctx); /* Free WOLFSSL_CTX object */
wolfSSL_Cleanup(); /* Free wolfSSL */
```

11.11.2 EchoServer

The echo server makes a call to `str_echo()` to handle reading and writing (whereas the client made a call to `str_cli()`). As with the client, modify `str_echo()` by replacing the `sockfd` parameter with a `WOLFSSL` object (`ssl`) parameter in the function signature:

```
void str_echo(WOLFSSL* ssl)
```

Replace the calls to `Read()` and `Writen()` with calls to the `wolfSSL_read()` and `wolfSSL_write()` functions. The modified `str_echo()` function, including error checking of return values, is shown below. Note that the type of the variable `n` has been changed from `ssize_t` to `int` in order to accommodate for the change from `read()` to `wolfSSL_read()`:

```
void
str_echo(WOLFSSL* ssl)
{
    int n;
    char buf[MAXLINE];

    while ( (n = wolfSSL_read(ssl, buf, MAXLINE)) > 0) {
        if(wolfSSL_write(ssl, buf, n) != n) {
            err_sys("wolfSSL_write failed");
        }
    }

    if( n < 0 )
        printf("wolfSSL_read error = %d\n", wolfSSL_get_error(ssl,n));
    else if( n == 0 )
        printf("The peer has closed the connection.\n");
}
```

In `main()` call the `str_echo()` function at the end of the for loop (soon to be changed to a while loop). After this function, inside the loop, make calls to free the `WOLFSSL` object and close the `connfd` socket:

```
str_echo(ssl); /* process the request */

wolfSSL_free(ssl); /* Free WOLFSSL object */
Close(connfd);
```

We will free the `ctx` and `cleanup` before the call to `exit`.

11.12 Signal Handling

11.12.1 Echoclient / Echoserver

In the echoclient and echoserver, we will need to add a signal handler for when the user closes the app by using “Ctrl+C”. The echo server is continually running in a loop. Because of this, we need to provide a way to break that loop when the user presses “Ctrl+C”. To do this, the first thing we need to do is change our loop to a while loop which terminates when an exit variable (`cleanup`) is set to true.

First, define a new static `int` variable called `cleanup` at the top of `tcpserv04.c` right after the `#include` statements:

```
static int cleanup; /* To handle shutdown */
```

Modify the echoserver loop by changing it from a for loop to a while loop:

```
while(cleanup != 1)
{
    /* echo server code here */
}
```

For the echoserver we need to disable the operating system from restarting calls which were being executed before the signal was handled after our handler has finished. By disabling these, the operating system will not restart calls to `accept()` after the signal has been handled. If we didn't do this, we would have to wait for another client to connect and disconnect before the echoserver would clean up resources and exit. To define the signal handler and turn off `SA_RESTART`, first define `act` and `oact` structures in the echoserver's `main()` function:

```
struct sigaction act, oact;
```

Insert the following code after variable declarations, before the call to `wolfSSL_Init()` in the main function:

```
/* Signal handling code */
struct sigaction act, oact;          /* Declare the sigaction structs */
act.sa_handler = sig_handler;        /* Tell act to use sig_handler */
sigemptyset(&act.sa_mask);          /* Tells act to exclude all sa_mask *
                                     * signals during execution of *
                                     * sig_handler. */
act.sa_flags = 0;                    /* States that act has a special *
                                     * flag of 0 */
sigaction(SIGINT, &act, &oact);      /* Tells the program to use (o)act *
                                     * on a signal or interrupt */
```

The echoserver's `sig_handler` function is shown below:

```
void sig_handler(const int sig)
{
    printf("\nSIGINT handled.\n");
    cleanup = 1;
    return;
}
```

That's it - the echoclient and echoserver are now enabled with TLSv1.2!!

What we did:

- Included the wolfSSL headers
- Initialized wolfSSL
- Created a `WOLFSSL_CTX` structure in which we chose what protocol we wanted to use
- Created a `WOLFSSL` object to use for sending and receiving data
- Replaced calls to `Writen()` and `Readline()` with `wolfSSL_write()` and `wolfSSL_read()`
- Freed `WOLFSSL`, `WOLFSSL_CTX`
- Made sure we handled client and server shutdown with signal handler

There are many more aspects and methods to configure and control the behavior of your SSL connections. For more detailed information, please see additional wolfSSL documentation and resources.

Once again, the completed source code can be found in the downloaded ZIP file at the top of this section.

11.13 Certificates

For testing purposes, you may use the certificates provided by wolfSSL. These can be found in the wolfSSL download, and specifically for this tutorial, they can be found in the `finished_src` folder.

For production applications, you should obtain correct and legitimate certificates from a trusted certificate authority.

11.14 Conclusion

This tutorial walked through the process of integrating the wolfSSL embedded SSL library into a simple client and server application. Although this example is simple, the same principles may be applied for adding SSL or TLS into your own application. The wolfSSL embedded SSL library provides all the features you would need in a compact and efficient package that has been optimized for both size and speed.

Being dual licensed under GPLv2 and standard commercial licensing, you are free to download the wolfSSL source code directly from our website. Feel free to post to our support forums (<https://www.wolfssl.com/forums>) with any questions or comments you might have. If you would like more information about our products, please contact info@wolfssl.com.

We welcome any feedback you have on this SSL tutorial. If you believe it could be improved or enhanced in order to make it either more useful, easier to understand, or more portable, please let us know at support@wolfssl.com.

12 Best Practices for Embedded Devices

12.1 Creating Private Keys

Embedding a private key into firmware allows anyone to extract the key and turns an otherwise secure connection into something nothing more secure than TCP.

We have a few ideas about creating private keys for SSL enabled devices.

1. Each device acting as a server should have a unique private key, just like in the non-embedded world.
2. If the key can't be placed onto the device before delivery, have it generated during setup.
3. If the device lacks the power to generate its own key during setup, have the client setting up the device generate the key and send it to the device.
4. If the client lacks the ability to generate a private key, have the client retrieve a unique private key over an SSL/TLS connection from the devices known website (for example).

wolfSSL (formerly CyaSSL) can be used in all of these steps to help ensure an embedded device has a secure unique private key. Taking these steps will go a long way towards securing the SSL connection itself.

12.2 Digitally Signing and Authenticating with wolfSSL

wolfSSL is a popular tool for digitally signing applications, libraries, or files prior to loading them on embedded devices. Most desktop and server operating systems allow creation of this type of functionality through system libraries, but stripped down embedded operating systems do not. The reason that embedded RTOS environments do not include digital signature functionality is because it has historically not been a requirement for most embedded applications. In today's world of connected devices and heightened security concerns, digitally signing what is loaded onto your embedded or mobile device has become a top priority.

Examples of embedded connected devices where this requirement was not found in years past include set top boxes, DVR's, POS systems, both VoIP and mobile phones, connected home, and even automobile-based computing systems. Because wolfSSL supports the key embedded and real time operating systems, encryption standards, and authentication functionality, it is a natural choice for embedded systems developers to use when adding digital signature functionality.

Generally, the process for setting up code and file signing on an embedded device are as follows:

1. The embedded systems developer will generate an RSA key pair.
2. A server-side script-based tool is developed
 1. The server side tool will create a hash of the code to be loaded on the device (with SHA-256 for example).
 2. The hash is then digitally signed, also called RSA private encrypt.
 3. A package is created that contains the code along with the digital signature.
3. The package is loaded on the device along with a way to get the RSA public key. The hash is re-created on the device then digitally verified (also called RSA public decrypt) against the existing digital signature.

Benefits to enabling digital signatures on your device include:

1. Easily enable a secure method for allowing third parties to load files to your device.
2. Ensure against malicious files finding their way onto your device.
3. Digitally secure firmware updates
4. Ensure against firmware updates from unauthorized parties

General information on code signing:

https://en.wikipedia.org/wiki/Code_signing

13 OpenSSL Compatibility

13.1 Compatibility with OpenSSL

wolfSSL (formerly CyaSSL) provides an OpenSSL compatibility header, `wolfssl/openssl/ssl.h`, in addition to the wolfSSL native API, to ease the transition into using wolfSSL or to aid in porting an existing OpenSSL application over to wolfSSL. For an overview of the OpenSSL Compatibility Layer, please continue reading below. To view the complete set of OpenSSL functions supported by wolfSSL, please see the `wolfssl/openssl/ssl.h` file.

The OpenSSL Compatibility Layer maps a subset of the most commonly-used OpenSSL commands to wolfSSL's native API functions. This should allow for an easy replacement of OpenSSL by wolfSSL in your application or project without changing much code.

Our test beds for OpenSSL compatibility are stunnel and Lighttpd, which means that we build both of them with wolfSSL as a way to test our OpenSSL compatibility API.

Building wolfSSL With Compatibility Layer:

1. Enable with (`--enable-opensslextra`) or by defining the macro `OPENSSL_EXTRA`.
`./configure --enable-opensslextra`
2. Include `<wolfssl/options.h>` as first wolfSSL header
3. Header files for migration are located under:
 - `./wolfssl/openssl/*.h`
 - Ex: `<wolfssl/openssl/ssl.h>`

13.2 Differences Between wolfSSL and OpenSSL

Many people are curious how wolfSSL compares to OpenSSL and what benefits there are to using an SSL/TLS library that has been optimized to run on embedded platforms. Obviously, OpenSSL is free and presents no initial costs to begin using, but we believe that wolfSSL will provide you with more

flexibility, an easier integration of SSL/TLS into your existing platform, current standards support, and much more – all provided under a very easy-to-use license model.

The points below outline several of the main differences between wolfSSL and OpenSSL.

1. With a 20-100 kB build size, wolfSSL is up to 20 times smaller than OpenSSL. wolfSSL is a better choice for resource constrained environments – where every byte matters.
2. wolfSSL is up to date with the most current standards of TLS 1.3 with DTLS. The wolfSSL team is dedicated to continually keeping wolfSSL up-to-date with current standards.
3. wolfSSL offers the best current ciphers and standards available today, including ciphers for streaming media support. In addition, the recently-introduced NTRU cipher allows speed increases of 20-200x over standard RSA.
4. wolfSSL is dual licensed under both the GPLv2 as well as a commercial license, where OpenSSL is available only under their unique license from multiple sources.
5. wolfSSL is backed by an outstanding company who cares about its users and about their security, and is always willing to help. The team actively works to improve and expand wolfSSL. The wolfSSL team is based primarily out of Bozeman, MT, Portland, OR, and Seattle, WA, along with other team members located around the globe.
6. wolfSSL is the leading SSL/TLS library for real time, mobile, and embedded systems by virtue of its breadth of platform support and successful implementations on embedded environments. Chances are we've already been ported to your environment. If not, let us know and we'll be glad to help.
7. wolfSSL offers several abstraction layers to make integrating SSL into your environment and platform as easy as possible. With an OS layer, a custom I/O layer, and a C Standard Library abstraction layer, integration has never been so easy.
8. wolfSSL offers several support packages for wolfSSL. Available directly through phone, email or the wolfSSL product support forums, your questions are answered quickly and accurately to help you make progress on your project as quickly as possible.

13.3 Supported OpenSSL Structures

- SSL_METHOD holds SSL version information and is either a client or server method. (Same as WOLFSSL_METHOD in the native wolfSSL API).
- SSL_CTX holds context information including certificates. (Same as WOLFSSL_CTX in the native wolfSSL API).
- SSL holds session information for a secure connection. (Same as WOLFSSL in the native wolfSSL API).

13.4 Supported OpenSSL Functions

The three structures shown above are usually initialized in the following way:

```
SSL_METHOD* method = SSLv3_client_method();
SSL_CTX* ctx = SSL_CTX_new(method);
SSL* ssl = SSL_new(ctx);
```

This establishes a client side SSL version 3 method, creates a context based on the method, and initializes the SSL session with the context. A server side program is no different except that the SSL_METHOD is created using SSLv3_server_method(), or one of the available functions. For a list of supported functions, please see the [Protocol Support](#) section. When using the OpenSSL Compatibility layer, the functions in this section should be modified by removing the “wolf” prefix. For example, the native wolfSSL API function:

```
wolfTLSv1_client_method()
```

Becomes:

```
TLsv1_client_method()
```

When an SSL connection is no longer needed the following calls free the structures created during initialization.

```
SSL_CTX_free(ctx);
SSL_free(ssl);
```

SSL_CTX_free() has the additional responsibility of freeing the associated SSL_METHOD. Failing to use the XXX_free() functions will result in a resource leak. Using the system's free() instead of the SSL ones results in undefined behavior.

Once an application has a valid SSL pointer from SSL_new(), the SSL handshake process can begin. From the client's view, SSL_connect() will attempt to establish a secure connection.

```
SSL_set_fd(ssl, sockfd);
SSL_connect(ssl);
```

Before the SSL_connect() can be issued, the user must supply wolfSSL with a valid socket file descriptor, sockfd in the example above. sockfd is typically the result of the TCP function socket() which is later established using TCP connect(). The following creates a valid client side socket descriptor for use with a local wolfSSL server on port 11111, error handling is omitted for simplicity.

```
int sockfd = socket(AF_INET, SOCK_STREAM, 0);
sockaddr_in servaddr;
memset(&servaddr, 0, sizeof(servaddr));
servaddr.sin_family = AF_INET;
servaddr.sin_port = htons(11111);
servaddr.sin_addr.s_addr = inet_addr("127.0.0.1");
connect(sockfd, (const sockaddr*)&servaddr, sizeof(servaddr));
```

Once a connection is established, the client may read and write to the server. Instead of using the TCP functions send() and receive(), wolfSSL and yaSSL use the SSL functions SSL_write() and SSL_read(). Here is a simple example from the client demo:

```
char msg[] = "hello wolfssl!";
int wrote = SSL_write(ssl, msg, sizeof(msg));
char reply[1024];
int read = SSL_read(ssl, reply, sizeof(reply));
reply[read] = 0;
printf("Server response: %s\n", reply);
```

The server connects in the same way, except that it uses SSL_accept() instead of SSL_connect(), analogous to the TCP API. See the server example for a complete server demo program.

13.5 x509 Certificates

Both the server and client can provide wolfSSL with certificates in either **PEM** or **DER**.

Typical usage is like this:

```
SSL_CTX_use_certificate_file(ctx, "certs/cert.pem",
SSL_FILETYPE_PEM);
SSL_CTX_use_PrivateKey_file(ctx, "certs/key.der",
SSL_FILETYPE_ASN1);
```

A key file can also be presented to the Context in either format. SSL_FILETYPE_PEM signifies the file is PEM formatted while SSL_FILETYPE_ASN1 declares the file to be in DER format. To verify that the key file is appropriate for use with the certificate the following function can be used:

```
SSL_CTX_check_private_key(ctx);
```

14 Licensing

14.1 Open Source

wolfSSL (formerly CyaSSL), yaSSL, wolfCrypt, yaSSH and TaoCrypt software are free software downloads and may be modified to the needs of the user as long as the user adheres to version two of the GPL License. The GPLv2 license can be found on the gnu.org website <https://www.gnu.org/licenses/old-licenses/gpl-2.0.html>.

wolfSSH software is a free software download and may be modified to the needs of the user as long as the user adheres to version three of the GPL license. The GPLv3 license can be found on the gnu.org website (<https://www.gnu.org/licenses/gpl.html>).

14.2 Commercial Licensing

Businesses and enterprises who wish to incorporate wolfSSL products into proprietary appliances or other commercial software products for re-distribution must license commercial versions. Commercial licenses for wolfSSL, yaSSL, and wolfCrypt are available for \$5,000 USD per end product or SKU. Licenses are generally issued for one product and include unlimited royalty-free distribution. Custom licensing terms are also available.

Commercial licenses are also available for wolfMQTT and wolfSSH. Please contact licensing@wolfssl.com with inquiries.

14.3 Support Packages

Support packages for wolfSSL products are available on an annual basis directly from wolfSSL. With three different package options, you can compare them side-by-side and choose the package that best fits your specific needs. Please see our Support Packages page (<https://www.wolfssl.com/products/support-and-maintenance>) for more details.

15 Support and Consulting

15.1 How to Get Support

For general product support, wolfSSL (formerly CyaSSL) maintains an online forum for the wolfSSL product family. Please post to the forums or contact wolfSSL directly with any questions.

- wolfSSL (yaSSL) Forums: <https://www.wolfssl.com/forums>
- Email Support: support@wolfssl.com

For information regarding wolfSSL products, questions regarding licensing, or general comments, please contact wolfSSL by emailing info@wolfssl.com. For support packages, please see [Licensing](#).

15.1.1 Bugs Reports and Support Issues

If you are submitting a bug report or asking about a problem, please include the following information with your submission:

1. wolfSSL version number
2. Operating System version
3. Compiler version
4. The exact error you are seeing
5. A description of how we can reproduce or try to replicate this problem

With the above information, we will do our best to resolve your problems. Without this information, it is very hard to pinpoint the source of the problem. wolfSSL values your feedback and makes it a top priority to get back to you as soon as possible.

15.2 Consulting

wolfSSL offers both on and off site consulting - providing feature additions, porting, a Competitive Upgrade Program (see [Competitive Upgrade Program](#)), and design consulting.

15.2.1 Feature Additions and Porting

We can add additional features that you may need which are not currently offered in our products on a contract or co-development basis. We also offer porting services on our products to new host languages or new operating environments.

15.2.2 Competitive Upgrade Program

We will help you move from an outdated or expensive SSL/TLS library to wolfSSL with low cost and minimal disturbance to your code base.

Program Outline:

1. You need to currently be using a commercial competitor to wolfSSL.
2. You will receive up to one week of on-site consulting to switch out your old SSL library for wolfSSL. Travel expenses are not included.
3. Normally, up to one week is the right amount of time for us to make the replacement in your code and do initial testing. Additional consulting on a replacement is available as needed.
4. You will receive the standard wolfSSL royalty free license to ship with your product.
5. The price is \$10,000.

The purpose of this program is to enable users who are currently spending too much on their embedded SSL implementation to move to wolfSSL with ease. If you are interested in learning more, then please contact us at info@wolfssl.com.

15.2.3 Design Consulting

If your application or framework needs to be secured with SSL/TLS but you are uncertain about how the optimal design of a secured system would be structured, we can help!

We offer design consulting for building SSL/TLS security into devices using wolfSSL. Our consultants can provide you with the following services:

1. *Assessment*: An evaluation of your current SSL/TLS implementation. We can give you advice on your current setup and how we think you could improve upon this by using wolfSSL.
2. *Design*: Looking at your system requirements and parameters, we'll work closely with you to make recommendations on how to implement wolfSSL into your application such that it provides you with optimal security.

If you would like to learn more about design consulting for building SSL into your application or device, please contact info@wolfssl.com for more information.

16 wolfSSL (formerly CyaSSL) Updates

16.1 Product Release Information

We regularly post update information on Twitter. For additional release information, you can keep track of our projects on GitHub, follow us on Facebook, or follow our daily blog.

- wolfSSL on GitHub - <https://www.github.com/wolfssl/wolfssl>
- wolfSSL on Twitter - <https://twitter.com/wolfSSL>
- wolfSSL on Facebook - <https://www.facebook.com/wolfSSL>
- wolfSSL on Reddit - <https://www.reddit.com/r/wolfssl/>
- Daily Blog - <https://www.wolfssl.com/blog>

17 wolfSSL API Reference

17.1 CertManager API

17.1.1 Functions

	Name
WOLFSSL_API WOLFSSL_CERT_MANAGER *	wolfSSL_CertManagerNew_ex (void * heap)Allocates and initializes a new Certificate Manager context.
WOLFSSL_API WOLFSSL_CERT_MANAGER *	wolfSSL_CertManagerNew (void)Allocates and initializes a new Certificate Manager context.
WOLFSSL_API void	wolfSSL_CertManagerFree (WOLFSSL_CERT_MANAGER *)Frees all resources associated with the context.
WOLFSSL_API int	wolfSSL_CertManagerLoadCA (WOLFSSL_CERT_MANAGER * , const char *)Loads a CA certificate from a file.
WOLFSSL_API int	wolfSSL_CertManagerLoadCABuffer (WOLFSSL_CERT_MANAGER * , const unsigned char * , int len)Loads a CA certificate from a buffer.
WOLFSSL_API int	wolfSSL_CertManagerUnloadCAs (WOLFSSL_CERT_MANAGER * cm)This function unloads all CA certificates from the context.
WOLFSSL_API int	wolfSSL_CertManagerUnload_trust_peers (WOLFSSL_CERT_MANAGER * cm)This function unloads all trust peers from the context.
WOLFSSL_API int	wolfSSL_CertManagerVerify (WOLFSSL_CERT_MANAGER * , const char * , int flags)Verifies a certificate chain.
WOLFSSL_API int	wolfSSL_CertManagerVerifyBuffer (WOLFSSL_CERT_MANAGER * cm, const unsigned char * , int len, int flags)Verifies a certificate chain from a buffer.
WOLFSSL_API void	wolfSSL_CertManagerSetVerify (WOLFSSL_CERT_MANAGER * cm, VerifyCallback cb)Sets the verify callback function.
WOLFSSL_API int	wolfSSL_CertManagerEnableCRL (WOLFSSL_CERT_MANAGER * , int opt)Enables CRL checking.
WOLFSSL_API int	wolfSSL_CertManagerDisableCRL (WOLFSSL_CERT_MANAGER *)Turns off CRL checking.
WOLFSSL_API int	wolfSSL_CertManagerLoadCRL (WOLFSSL_CERT_MANAGER * , const char *)Loads a CRL from a file.
WOLFSSL_API int	wolfSSL_CertManagerLoadCRLBuffer (WOLFSSL_CERT_MANAGER * , const unsigned char * , int len)Loads a CRL from a buffer.
WOLFSSL_API int	wolfSSL_CertManagerSetCRL_Cb (WOLFSSL_CERT_MANAGER * , CbMisuse cb)Sets the CRL callback function.
WOLFSSL_API int	wolfSSL_CertManagerCheckOCSP (WOLFSSL_CERT_MANAGER * , unsigned char * , int len, int flags)Checks the OCSP status of a certificate.
WOLFSSL_API int	wolfSSL_CertManagerEnableOCSP (WOLFSSL_CERT_MANAGER * , int opt)Enables OCSP checking.
WOLFSSL_API int	wolfSSL_CertManagerDisableOCSP (WOLFSSL_CERT_MANAGER *)Disables OCSP checking.
WOLFSSL_API int	wolfSSL_CertManagerSetOCSPOverrideURL (WOLFSSL_CERT_MANAGER * , const char *)Sets the OCSP override URL.
WOLFSSL_API int	wolfSSL_CertManagerSetOCSP_Cb (WOLFSSL_CERT_MANAGER * , CbOCSP cb)Sets the OCSP callback function.
WOLFSSL_API int	wolfSSL_CertManagerEnableOCSPStapling (WOLFSSL_CERT_MANAGER * , int opt)Enables OCSP stapling.

17.1.2 Functions Documentation

17.1.2.1 function wolfSSL_CertManagerNew_ex

```
WOLFSSL_API WOLFSSL_CERT_MANAGER * wolfSSL_CertManagerNew_ex(  
    void * heap  
)
```

Allocates and initializes a new Certificate Manager context. This context may be used independent of SSL needs. It may be used to load certificates, verify certificates, and check the revocation status.

Parameters:

- **none** No parameters.

See: [wolfSSL_CertManagerFree](#)

Return:

- WOLFSSL_CERT_MANAGER If successful the call will return a valid WOLFSSL_CERT_MANAGER pointer.
- NULL will be returned for an error state.

17.1.2.2 function wolfSSL_CertManagerNew

```
WOLFSSL_API WOLFSSL_CERT_MANAGER * wolfSSL_CertManagerNew(
    void
)
```

Allocates and initializes a new Certificate Manager context. This context may be used independent of SSL needs. It may be used to load certificates, verify certificates, and check the revocation status.

Parameters:

- **none** No parameters.

See: [wolfSSL_CertManagerFree](#)

Return:

- WOLFSSL_CERT_MANAGER If successful the call will return a valid WOLFSSL_CERT_MANAGER pointer.
- NULL will be returned for an error state.

Example

```
#import <wolfssl/ssl.h>
```

```
WOLFSSL_CERT_MANAGER* cm;
cm = wolfSSL_CertManagerNew();
if (cm == NULL) {
    // error creating new cert manager
}
```

17.1.2.3 function wolfSSL_CertManagerFree

```
WOLFSSL_API void wolfSSL_CertManagerFree(
    WOLFSSL_CERT_MANAGER *
)
```

Frees all resources associated with the Certificate Manager context. Call this when you no longer need to use the Certificate Manager.

Parameters:

- **cm** a pointer to a WOLFSSL_CERT_MANAGER structure, created using [wolfSSL_CertManagerNew\(\)](#).

See: [wolfSSL_CertManagerNew](#)

Return: none

Example

```
#include <wolfssl/ssl.h>
```

```
WOLFSSL_CERT_MANAGER* cm;
```

```
...
wolfSSL_CertManagerFree(cm);
```

17.1.2.4 function wolfSSL_CertManagerLoadCA

```
WOLFSSL_API int wolfSSL_CertManagerLoadCA(
    WOLFSSL_CERT_MANAGER * ,
    const char * f,
    const char * d
)
```

Specifies the locations for CA certificate loading into the manager context. The PEM certificate CAfile may contain several trusted CA certificates. If CApath is not NULL it specifies a directory containing CA certificates in PEM format.

Parameters:

- **cm** a pointer to a WOLFSSL_CERT_MANAGER structure, created using [wolfSSL_CertManagerNew\(\)](#).
- **file** pointer to the name of the file containing CA certificates to load.
- **path** pointer to the name of a directory path containing CA certificates to load. The NULL pointer may be used if no certificate directory is desired.

See: [wolfSSL_CertManagerVerify](#)

Return:

- SSL_SUCCESS If successful the call will return.
- SSL_BAD_FILETYPE will be returned if the file is the wrong format.
- SSL_BAD_FILE will be returned if the file doesn't exist, can't be read, or is corrupted.
- MEMORY_E will be returned if an out of memory condition occurs.
- ASN_INPUT_E will be returned if Base16 decoding fails on the file.
- BAD_FUNC_ARG is the error that will be returned if a pointer is not provided.
- SSL_FATAL_ERROR - will be returned upon failure.

Example

```
#include <wolfssl/ssl.h>

int ret = 0;
WOLFSSL_CERT_MANAGER* cm;
...
ret = wolfSSL_CertManagerLoadCA(cm, "path/to/cert-file.pem", 0);
if (ret != SSL_SUCCESS) {
    // error loading CA certs into cert manager
}
```

17.1.2.5 function wolfSSL_CertManagerLoadCABuffer

```
WOLFSSL_API int wolfSSL_CertManagerLoadCABuffer(
    WOLFSSL_CERT_MANAGER * ,
    const unsigned char * in,
    long sz,
    int format
)
```

Loads the CA Buffer by calling `wolfSSL_CTX_load_verify_buffer` and returning that result using a temporary cm so as not to lose the information in the cm passed into the function.

Parameters:

- **cm** a pointer to a WOLFSSL_CERT_MANAGER structure, created using `wolfSSL_CertManagerNew()`.
- **in** buffer for cert information.
- **sz** length of the buffer.
- **format** certificate format, either PEM or DER.

See:

- `wolfSSL_CTX_load_verify_buffer`
- `ProcessChainBuffer`
- `ProcessBuffer`
- `cm_pick_method`

Return:

- `SSL_FATAL_ERROR` is returned if the `WOLFSSL_CERT_MANAGER` struct is `NULL` or if `wolfSSL_CTX_new()` returns `NULL`.
- `SSL_SUCCESS` is returned for a successful execution.

Example

```
WOLFSSL_CERT_MANAGER* cm = (WOLFSSL_CERT_MANAGER*)vp;
...
const unsigned char* in;
long sz;
int format;
...
if(wolfSSL_CertManagerLoadCABuffer(vp, sz, format) != SSL_SUCCESS){
    Error returned. Failure case code block.
}
```

17.1.2.6 function `wolfSSL_CertManagerUnloadCAs`

```
WOLFSSL_API int wolfSSL_CertManagerUnloadCAs(
    WOLFSSL_CERT_MANAGER * cm
)
```

This function unloads the CA signer list.

Parameters:

- **cm** a pointer to a `WOLFSSL_CERT_MANAGER` structure, created using `wolfSSL_CertManagerNew()`.

See:

- `FreeSignerTable`
- `UnlockMutex`

Return:

- `SSL_SUCCESS` returned on successful execution of the function.
- `BAD_FUNC_ARG` returned if the `WOLFSSL_CERT_MANAGER` is `NULL`.
- `BAD_MUTEX_E` returned if there was a mutex error.

Example

```
#include <wolfssl/ssl.h>

WOLFSSL_CTX* ctx = wolfSSL_CTX_new(protocol method);
WOLFSSL_CERT_MANAGER* cm = wolfSSL_CertManagerNew();
...
if(wolfSSL_CertManagerUnloadCAs(ctx->cm) != SSL_SUCCESS){
```

```
    Failure case.  
}
```

17.1.2.7 function wolfSSL_CertManagerUnload_trust_peers

```
WOLFSSL_API int wolfSSL_CertManagerUnload_trust_peers(  
    WOLFSSL_CERT_MANAGER * cm  
)
```

The function will free the Trusted Peer linked list and unlocks the trusted peer list.

Parameters:

- **cm** a pointer to a WOLFSSL_CERT_MANAGER structure, created using [wolfSSL_CertManagerNew\(\)](#).

See: UnLockMutex

Return:

- SSL_SUCCESS if the function completed normally.
- BAD_FUNC_ARG if the WOLFSSL_CERT_MANAGER is NULL.
- BAD_MUTEX_E mutex error if tpLock, a member of the WOLFSSL_CERT_MANAGER struct, is 0 (null).

Example

```
#include <wolfssl/ssl.h>
```

```
WOLFSSL_CTX* ctx = WOLFSSL_CTX_new(Protocol define);  
WOLFSSL_CERT_MANAGER* cm = wolfSSL_CertManagerNew();  
...  
if(wolfSSL_CertManagerUnload_trust_peers(cm) != SSL_SUCCESS){  
    The function did not execute successfully.  
}
```

17.1.2.8 function wolfSSL_CertManagerVerify

```
WOLFSSL_API int wolfSSL_CertManagerVerify(  
    WOLFSSL_CERT_MANAGER * ,  
    const char * f,  
    int format  
)
```

Specifies the certificate to verify with the Certificate Manager context. The format can be SSL_FILETYPE_PEM or SSL_FILETYPE_ASN1.

Parameters:

- **cm** a pointer to a WOLFSSL_CERT_MANAGER structure, created using [wolfSSL_CertManagerNew\(\)](#).
- **fname** pointer to the name of the file containing the certificates to verify.
- **format** format of the certificate to verify - either SSL_FILETYPE_ASN1 or SSL_FILETYPE_PEM.

See:

- [wolfSSL_CertManagerLoadCA](#)
- [wolfSSL_CertManagerVerifyBuffer](#)

Return:

- SSL_SUCCESS If successful.
- ASN_SIG_CONFIRM_E will be returned if the signature could not be verified.
- ASN_SIG_OID_E will be returned if the signature type is not supported.
- CRL_CERT_REVOKED is an error that is returned if this certificate has been revoked.

- CRL_MISSING is an error that is returned if a current issuer CRL is not available.
- ASN_BEFORE_DATE_E will be returned if the current date is before the before date.
- ASN_AFTER_DATE_E will be returned if the current date is after the after date.
- SSL_BAD_FILETYPE will be returned if the file is the wrong format.
- SSL_BAD_FILE will be returned if the file doesn't exist, can't be read, or is corrupted.
- MEMORY_E will be returned if an out of memory condition occurs.
- ASN_INPUT_E will be returned if Base16 decoding fails on the file.
- BAD_FUNC_ARG is the error that will be returned if a pointer is not provided.

Example

```
int ret = 0;
WOLFSSL_CERT_MANAGER* cm;
...

ret = wolfSSL_CertManagerVerify(cm, "path/to/cert-file.pem",
SSL_FILETYPE_PEM);
if (ret != SSL_SUCCESS) {
    error verifying certificate
}
```

17.1.2.9 function wolfSSL_CertManagerVerifyBuffer

```
WOLFSSL_API int wolfSSL_CertManagerVerifyBuffer(
    WOLFSSL_CERT_MANAGER * cm,
    const unsigned char * buff,
    long sz,
    int format
)
```

Specifies the certificate buffer to verify with the Certificate Manager context. The format can be SSL_FILETYPE_PEM or SSL_FILETYPE_ASN1.

Parameters:

- **cm** a pointer to a WOLFSSL_CERT_MANAGER structure, created using [wolfSSL_CertManagerNew\(\)](#).
- **buff** buffer containing the certificates to verify.
- **sz** size of the buffer, buf.
- **format** format of the certificate to verify, located in buf - either SSL_FILETYPE_ASN1 or SSL_FILETYPE_PEM.

See:

- [wolfSSL_CertManagerLoadCA](#)
- [wolfSSL_CertManagerVerify](#)

Return:

- SSL_SUCCESS If successful.
- ASN_SIG_CONFIRM_E will be returned if the signature could not be verified.
- ASN_SIG_OID_E will be returned if the signature type is not supported.
- CRL_CERT_REVOKED is an error that is returned if this certificate has been revoked.
- CRL_MISSING is an error that is returned if a current issuer CRL is not available.
- ASN_BEFORE_DATE_E will be returned if the current date is before the before date.
- ASN_AFTER_DATE_E will be returned if the current date is after the after date.
- SSL_BAD_FILETYPE will be returned if the file is the wrong format.
- SSL_BAD_FILE will be returned if the file doesn't exist, can't be read, or is corrupted.
- MEMORY_E will be returned if an out of memory condition occurs.
- ASN_INPUT_E will be returned if Base16 decoding fails on the file.

- BAD_FUNC_ARG is the error that will be returned if a pointer is not provided.

Example

```
#include <wolfssl/ssl.h>

int ret = 0;
int sz = 0;
WOLFSSL_CERT_MANAGER* cm;
byte certBuff[...];
...

ret = wolfSSL_CertManagerVerifyBuffer(cm, certBuff, sz, SSL_FILETYPE_PEM);
if (ret != SSL_SUCCESS) {
    error verifying certificate
}
```

17.1.2.10 function wolfSSL_CertManagerSetVerify

```
WOLFSSL_API void wolfSSL_CertManagerSetVerify(
    WOLFSSL_CERT_MANAGER * cm,
    VerifyCallback vc
)
```

The function sets the verifyCallback function in the Certificate Manager. If present, it will be called for each cert loaded. If there is a verification error, the verify callback can be used to over-ride the error.

Parameters:

- **cm** a pointer to a WOLFSSL_CERT_MANAGER structure, created using [wolfSSL_CertManagerNew\(\)](#).
- **vc** a VerifyCallback function pointer to the callback routine

See: [wolfSSL_CertManagerVerify](#)

Return: none No return.

Example

```
#include <wolfssl/ssl.h>

int myVerify(int preverify, WOLFSSL_X509_STORE_CTX* store)
{ // do custom verification of certificate }

WOLFSSL_CTX* ctx = WOLFSSL_CTX_new(Protocol define);
WOLFSSL_CERT_MANAGER* cm = wolfSSL_CertManagerNew();
...
wolfSSL_CertManagerSetVerify(cm, myVerify);
```

17.1.2.11 function wolfSSL_CertManagerEnableCRL

```
WOLFSSL_API int wolfSSL_CertManagerEnableCRL(
    WOLFSSL_CERT_MANAGER * ,
    int options
)
```

Turns on Certificate Revocation List checking when verifying certificates with the Certificate Manager. By default, CRL checking is off. options include WOLFSSL_CRL_CHECKALL which performs CRL checking on each certificate in the chain versus the Leaf certificate only which is the default.

Parameters:

- **cm** a pointer to a WOLFSSL_CERT_MANAGER structure, created using [wolfSSL_CertManagerNew\(\)](#).
- **options** options to use when enabling the Certification Manager, cm.

See: [wolfSSL_CertManagerDisableCRL](#)

Return:

- SSL_SUCCESS If successful the call will return.
- NOT_COMPILED_IN will be returned if wolfSSL was not built with CRL enabled.
- MEMORY_E will be returned if an out of memory condition occurs.
- BAD_FUNC_ARG is the error that will be returned if a pointer is not provided.
- SSL_FAILURE will be returned if the CRL context cannot be initialized properly.

Example

```
#include <wolfssl/ssl.h>

int ret = 0;
WOLFSSL_CERT_MANAGER* cm;
...

ret = wolfSSL_CertManagerEnableCRL(cm, 0);
if (ret != SSL_SUCCESS) {
    error enabling cert manager
}

...
```

17.1.2.12 function wolfSSL_CertManagerDisableCRL

```
WOLFSSL_API int wolfSSL_CertManagerDisableCRL(
    WOLFSSL_CERT_MANAGER *
```

Turns off Certificate Revocation List checking when verifying certificates with the Certificate Manager. By default, CRL checking is off. You can use this function to temporarily or permanently disable CRL checking with this Certificate Manager context that previously had CRL checking enabled.

Parameters:

- **cm** a pointer to a WOLFSSL_CERT_MANAGER structure, created using [wolfSSL_CertManagerNew\(\)](#).

See: [wolfSSL_CertManagerEnableCRL](#)

Return:

- SSL_SUCCESS If successful the call will return.
- BAD_FUNC_ARG is the error that will be returned if a function pointer is not provided.

Example

```
#include <wolfssl/ssl.h>

int ret = 0;
WOLFSSL_CERT_MANAGER* cm;
...

ret = wolfSSL_CertManagerDisableCRL(cm);
if (ret != SSL_SUCCESS) {
    error disabling cert manager
}

...
```

17.1.2.13 function `wolfSSL_CertManagerLoadCRL`

```
WOLFSSL_API int wolfSSL_CertManagerLoadCRL(  
    WOLFSSL_CERT_MANAGER * ,  
    const char * ,  
    int ,  
    int  
)
```

Error checks and passes through to `LoadCRL()` in order to load the cert into the CRL for revocation checking.

Parameters:

- **cm** a pointer to a `WOLFSSL_CERT_MANAGER` structure, created using `wolfSSL_CertManagerNew()`.
- **path** a constant char pointer holding the CRL path.
- **type** type of certificate to be loaded.
- **monitor** requests monitoring in `LoadCRL()`.

See:

- `wolfSSL_CertManagerEnableCRL`
- `wolfSSL_LoadCRL`

Return:

- `SSL_SUCCESS` if there is no error in `wolfSSL_CertManagerLoadCRL` and if `LoadCRL` returns successfully.
- `BAD_FUNC_ARG` if the `WOLFSSL_CERT_MANAGER` struct is `NULL`.
- `SSL_FATAL_ERROR` if `wolfSSL_CertManagerEnableCRL` returns anything other than `SSL_SUCCESS`.
- `BAD_PATH_ERROR` if the path is `NULL`.
- `MEMORY_E` if `LoadCRL` fails to allocate heap memory.

Example

```
#include <wolfssl/ssl.h>  
  
int wolfSSL_LoadCRL(WOLFSSL* ssl, const char* path, int type,  
int monitor);  
...  
wolfSSL_CertManagerLoadCRL(SSL_CM(ssl), path, type, monitor);
```

17.1.2.14 function `wolfSSL_CertManagerLoadCRLBuffer`

```
WOLFSSL_API int wolfSSL_CertManagerLoadCRLBuffer(  
    WOLFSSL_CERT_MANAGER * ,  
    const unsigned char * ,  
    long sz,  
    int  
)
```

The function loads the CRL file by calling `BufferLoadCRL`.

Parameters:

- **cm** a pointer to a `WOLFSSL_CERT_MANAGER` structure.
- **buff** a constant byte type and is the buffer.
- **sz** a long int representing the size of the buffer.
- **type** a long integer that holds the certificate type.

See:

- BufferLoadCRL
- [wolfSSL_CertManagerEnableCRL](#)

Return:

- SSL_SUCCESS returned if the function completed without errors.
- BAD_FUNC_ARG returned if the WOLFSSL_CERT_MANAGER is NULL.
- SSL_FATAL_ERROR returned if there is an error associated with the WOLFSSL_CERT_MANAGER.

Example

```
#include <wolfssl/ssl.h>

WOLFSSL_CERT_MANAGER* cm;
const unsigned char* buff;
long sz; size of buffer
int type; cert type
...
int ret = wolfSSL_CertManagerLoadCRLBuffer(cm, buff, sz, type);
if(ret == SSL_SUCCESS){
    return ret;
} else {
    Failure case.
}
```

17.1.2.15 function [wolfSSL_CertManagerSetCRL_Cb](#)

```
WOLFSSL_API int wolfSSL_CertManagerSetCRL_Cb(
    WOLFSSL_CERT_MANAGER * ,
    CbMissingCRL
)
```

This function sets the CRL Certificate Manager callback. If HAVE_CRL is defined and a matching CRL record is not found then the cbMissingCRL is called (set via [wolfSSL_CertManagerSetCRL_Cb](#)). This allows you to externally retrieve the CRL and load it.

Parameters:

- **cm** the WOLFSSL_CERT_MANAGER structure holding the information for the certificate.
- **cb** a function pointer to (*CbMissingCRL) that is set to the cbMissingCRL member of the WOLFSSL_CERT_MANAGER.

See:

- CbMissingCRL
- [wolfSSL_SetCRL_Cb](#)

Return:

- SSL_SUCCESS returned upon successful execution of the function and subroutines.
- BAD_FUNC_ARG returned if the WOLFSSL_CERT_MANAGER structure is NULL.

Example

```
#include <wolfssl/ssl.h>

WOLFSSL_CTX* ctx = wolfSSL_CTX_new(protocol method);
WOLFSSL* ssl = wolfSSL_new(ctx);
...
void cb(const char* url){
    Function body.
}
```

```

}
...
CbMissingCRL cb = CbMissingCRL;
...
if(ctx){
    return wolfSSL_CertManagerSetCRL_Cb(SSL_CM(ssl), cb);
}

```

17.1.2.16 function wolfSSL_CertManagerCheckOCSP

```

WOLFSSL_API int wolfSSL_CertManagerCheckOCSP(
    WOLFSSL_CERT_MANAGER * ,
    unsigned char * ,
    int sz
)

```

The function enables the WOLFSSL_CERT_MANAGER's member, ocsEnabled to signify that the OCSP check option is enabled.

Parameters:

- **cm** a pointer to a WOLFSSL_CERT_MANAGER structure, created using `wolfSSL_CertManagerNew()`.
- **der** a byte pointer to the certificate.
- **sz** an int type representing the size of the DER cert.

See:

- ParseCertRelative
- CheckCertOCSP

Return:

- SSL_SUCCESS returned on successful execution of the function. The ocsEnabled member of the WOLFSSL_CERT_MANAGER is enabled.
- BAD_FUNC_ARG returned if the WOLFSSL_CERT_MANAGER structure is NULL or if an argument value that is not allowed is passed to a subroutine.
- MEMORY_E returned if there is an error allocating memory within this function or a subroutine.

Example

```

#import <wolfssl/ssl.h>

WOLFSSL* ssl = wolfSSL_new(ctx);
byte* der;
int sz; size of der
...
if(wolfSSL_CertManagerCheckOCSP(cm, der, sz) != SSL_SUCCESS){
    Failure case.
}

```

17.1.2.17 function wolfSSL_CertManagerEnableOCSP

```

WOLFSSL_API int wolfSSL_CertManagerEnableOCSP(
    WOLFSSL_CERT_MANAGER * ,
    int options
)

```

Turns on OCSP if it's turned off and if compiled with the set option available.

Parameters:

- **cm** a pointer to a WOLFSSL_CERT_MANAGER structure, created using [wolfSSL_CertManagerNew\(\)](#).
- **options** used to set values in WOLFSSL_CERT_MANAGER struct.

See: [wolfSSL_CertManagerNew](#)

Return:

- SSL_SUCCESS returned if the function call is successful.
- BAD_FUNC_ARG if cm struct is NULL.
- MEMORY_E if WOLFSSL_OCSP struct value is NULL.
- SSL_FAILURE initialization of WOLFSSL_OCSP struct fails to initialize.
- NOT_COMPILED_IN build not compiled with correct feature enabled.

Example

```
#include <wolfssl/ssl.h>

WOLFSSL_CTX* ctx = wolfSSL_CTX_new(protocol method);
WOLFSSL* ssl = wolfSSL_new(ctx);
WOLFSSL_CERT_MANAGER* cm = wolfSSL_CertManagerNew();
int options;
...
if(wolfSSL_CertManagerEnableOCSP(SSL_CM(ssl), options) != SSL_SUCCESS){
    Failure case.
}
```

17.1.2.18 function wolfSSL_CertManagerDisableOCSP

```
WOLFSSL_API int wolfSSL_CertManagerDisableOCSP(
    WOLFSSL_CERT_MANAGER *
```

)

Disables OCSP certificate revocation.

Parameters:

- **ssl** - a pointer to a WOLFSSL structure, created using [wolfSSL_new\(\)](#).

See: [wolfSSL_DisableCRL](#)

Return:

- SSL_SUCCESS wolfSSL_CertManagerDisableCRL successfully disabled the crlEnabled member of the WOLFSSL_CERT_MANAGER structure.
- BAD_FUNC_ARG the WOLFSSL structure was NULL.

Example

```
#include <wolfssl/ssl.h>

WOLFSSL_CTX* ctx = wolfSSL_CTX_new(method);
WOLFSSL* ssl = wolfSSL_new(ctx);
...
if(wolfSSL_CertManagerDisableOCSP(ssl) != SSL_SUCCESS){
    Fail case.
}
```

17.1.2.19 function wolfSSL_CertManagerSetOCSPOverrideURL

```
WOLFSSL_API int wolfSSL_CertManagerSetOCSPOverrideURL(
    WOLFSSL_CERT_MANAGER * ,
```

```
    const char *
)
```

The function copies the url to the ocsOverrideURL member of the WOLFSSL_CERT_MANAGER structure.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using [wolfSSL_new\(\)](#).

See:

- ocsOverrideURL
- [wolfSSL_SetOCSP_OverrideURL](#)

Return:

- SSL_SUCCESS the function was able to execute as expected.
- BAD_FUNC_ARG the WOLFSSL_CERT_MANAGER struct is NULL.
- MEMORY_E Memory was not able to be allocated for the ocsOverrideURL member of the certificate manager.

Example

```
#include <wolfssl/ssl.h>
WOLFSSL_CERT_MANAGER* cm = wolfSSL_CertManagerNew();
const char* url;
...
int wolfSSL_SetOCSP_OverrideURL(WOLFSSL* ssl, const char* url)
...
if(wolfSSL_CertManagerSetOCSPOverrideURL(SSL_CM(ssl), url) != SSL_SUCCESS){
    Failure case.
}
```

17.1.2.20 function wolfSSL_CertManagerSetOCSP_Cb

```
WOLFSSL_API int wolfSSL_CertManagerSetOCSP_Cb(
    WOLFSSL_CERT_MANAGER * ,
    CbOCSP_IO ,
    CbOCSPRespFree ,
    void *
)
```

The function sets the OCSP callback in the WOLFSSL_CERT_MANAGER.

Parameters:

- **cm** a pointer to a WOLFSSL_CERT_MANAGER structure.
- **ioCb** a function pointer of type CbOCSP_IO.
- **respFreeCb** - a function pointer of type CbOCSPRespFree.
- **ioCbCtx** - a void pointer variable to the I/O callback user registered context.

See:

- [wolfSSL_CertManagerSetOCSPOverrideURL](#)
- [wolfSSL_CertManagerCheckOCSP](#)
- [wolfSSL_CertManagerEnableOCSPStapling](#)
- [wolfSSL_EnableOCSP](#)
- [wolfSSL_DisableOCSP](#)
- [wolfSSL_SetOCSP_Cb](#)

Return:

- SSL_SUCCESS returned on successful execution. The arguments are saved in the WOLFSSL_CERT_MANAGER structure.
- BAD_FUNC_ARG returned if the WOLFSSL_CERT_MANAGER is NULL.

Example

```
#include <wolfssl/ssl.h>
```

```
wolfSSL_SetOCSP_Cb(WOLFSSL* ssl, CbOCSPIO ioCb,
CbOCSPRespFree respFreeCb, void* ioCbCtx){
...
return wolfSSL_CertManagerSetOCSP_Cb(SSL_CM(ssl), ioCb, respFreeCb, ioCbCtx);
```

17.1.2.21 function wolfSSL_CertManagerEnableOCSPStapling

```
WOLFSSL_API int wolfSSL_CertManagerEnableOCSPStapling(
    WOLFSSL_CERT_MANAGER * cm
)
```

This function turns on OCSP stapling if it is not turned on as well as set the options.

Parameters:

- **cm** a pointer to a WOLFSSL_CERT_MANAGER structure, a member of the WOLFSSL_CTX structure.

See: [wolfSSL_CTX_EnableOCSPStapling](#)

Return:

- SSL_SUCCESS returned if there were no errors and the function executed successfully.
- BAD_FUNC_ARG returned if the WOLFSSL_CERT_MANAGER structure is NULL or otherwise if there was a unpermitted argument value passed to a subroutine.
- MEMORY_E returned if there was an issue allocating memory.
- SSL_FAILURE returned if the initialization of the OCSP structure failed.
- NOT_COMPILED_IN returned if wolfSSL was not compiled with HAVE_CERTIFICATE_STATUS_REQUEST option.

Example

```
int wolfSSL_CTX_EnableOCSPStapling(WOLFSSL_CTX* ctx){
...
return wolfSSL_CertManagerEnableOCSPStapling(ctx->cm);
```

17.2 Memory Handling

17.2.1 Functions

	Name

WOLFSSL_API void	wolfSSL_Free (void * ptr, void * heap, int type)	This function is similar to free(), but calls the me
WOLFSSL_API void *	wolfSSL_Realloc (void * ptr, size_t size, void * heap, int type)	This function is similar to realloc()
WOLFSSL_API int	wolfSSL_SetAllocators (wolfSSL_Malloc_cb , wolfSSL_Free_cb , wolfSSL_Realloc_cb)	This function
WOLFSSL_API int	wolfSSL_StaticBufferSz (byte * buffer, word32 sz, int flag)	This function is available when static
WOLFSSL_API int	wolfSSL_MemoryPaddingSz (void)	This function is available when static memory feature is us
WOLFSSL_API void *	XMALLOC (size_t n, void * heap, int type)	This is not actually a function, but rather a preprocess
WOLFSSL_API void *	XREALLOC (void * p, size_t n, void * heap, int type)	This is not actually a function, but rather a p
WOLFSSL_API void	XFREE (void * p, void * heap, int type)	This is not actually a function, but rather a preprocessor

17.2.2 Functions Documentation

17.2.2.1 function wolfSSL_Malloc

```
WOLFSSL_API void * wolfSSL_Malloc(  
    size_t size,  
    void * heap,  
    int type  
)
```

This function is similar to malloc(), but calls the memory allocation function which wolfSSL has been configured to use. By default, wolfSSL uses malloc(). This can be changed using the wolfSSL memory abstraction layer - see wolfSSL_SetAllocators(). Note wolfSSL_Malloc is not called directly by wolfSSL, but instead called by macro XMALLOC. For the default build only the size argument exists. If using WOLFSSL_STATIC_MEMORY build then heap and type arguments are included.

Parameters:

- **size** size, in bytes, of the memory to allocate
- **heap** heap hint to use for memory. Can be NULL
- **type** dynamic type (see DYNAMIC_TYPE_ list in [types.h](#))

See:

- [wolfSSL_Free](#)
- [wolfSSL_Realloc](#)
- [wolfSSL_SetAllocators](#)
- [XMALLOC](#)
- [XFREE](#)
- [XREALLOC](#)

Return:

- pointer If successful, this function returns a pointer to allocated memory.
- error If there is an error, NULL will be returned.

Example

```
int* tenInts = (int*)wolfSSL_Malloc(sizeof(int)*10);
```

17.2.2.2 function wolfSSL_Free

```
WOLFSSL_API void wolfSSL_Free(  
    void * ptr,  
    void * heap,  
    int type  
)
```

This function is similar to free(), but calls the memory free function which wolfSSL has been configured to use. By default, wolfSSL uses free(). This can be changed using the wolfSSL memory abstraction layer - see wolfSSL_SetAllocators(). Note wolfSSL_Free is not called directly by wolfSSL, but instead called by macro XFREE. For the default build only the ptr argument exists. If using WOLFSSL_STATIC_MEMORY build then heap and type arguments are included.

Parameters:

- **ptr** pointer to the memory to be freed.
- **heap** heap hint to use for memory. Can be NULL
- **type** dynamic type (see DYNAMIC_TYPE_ list in [types.h](#))

See:

- `wolfSSL_Alloc`
- `wolfSSL_Realloc`
- `wolfSSL_SetAllocators`
- `XMALLOC`
- `XFREE`
- `XREALLOC`

Return: none No returns.

Example

```
int* tenInts = (int*)wolfSSL_Malloc(sizeof(int)*10);
// process data as desired
...
if(tenInts) {
    wolfSSL_Free(tenInts);
}
```

17.2.2.3 function `wolfSSL_Realloc`

```
WOLFSSL_API void * wolfSSL_Realloc(
    void * ptr,
    size_t size,
    void * heap,
    int type
)
```

This function is similar to `realloc()`, but calls the memory re-allocation function which wolfSSL has been configured to use. By default, wolfSSL uses `realloc()`. This can be changed using the wolfSSL memory abstraction layer - see `wolfSSL_SetAllocators()`. Note `wolfSSL_Realloc` is not called directly by wolfSSL, but instead called by macro `XREALLOC`. For the default build only the size argument exists. If using `WOLFSSL_STATIC_MEMORY` build then heap and type arguments are included.

Parameters:

- **ptr** pointer to the previously-allocated memory, to be reallocated.
- **size** number of bytes to allocate.
- **heap** heap hint to use for memory. Can be NULL
- **type** dynamic type (see `DYNAMIC_TYPE_` list in [types.h](#))

See:

- `wolfSSL_Free`
- `wolfSSL_Malloc`
- `wolfSSL_SetAllocators`
- `XMALLOC`
- `XFREE`
- `XREALLOC`

Return:

- pointer If successful, this function returns a pointer to re-allocated memory. This may be the same pointer as ptr, or a new pointer location.
- Null If there is an error, NULL will be returned.

Example

```
int* tenInts = (int*)wolfSSL_Malloc(sizeof(int)*10);
int* twentyInts = (int*)wolfSSL_Realloc(tenInts, sizeof(int)*20);
```

17.2.2.4 function wolfSSL_SetAllocators

```
WOLFSSL_API int wolfSSL_SetAllocators(  
    wolfSSL_Malloc_cb ,  
    wolfSSL_Free_cb ,  
    wolfSSL_Realloc_cb  
)
```

This function registers the allocation functions used by wolfSSL. By default, if the system supports it, malloc/free and realloc are used. Using this function allows the user at runtime to install their own memory handlers.

Parameters:

- **malloc_function** memory allocation function for wolfSSL to use. Function signature must match wolfSSL_Malloc_cb prototype, above.
- **free_function** memory free function for wolfSSL to use. Function signature must match wolfSSL_Free_cb prototype, above.
- **realloc_function** memory re-allocation function for wolfSSL to use. Function signature must match wolfSSL_Realloc_cb prototype, above.

See: none

Return:

- Success If successful this function will return 0.
- BAD_FUNC_ARG is the error that will be returned if a function pointer is not provided.

Example

```
static void* MyMalloc(size_t size)  
{  
    // custom malloc function  
}  
  
static void MyFree(void* ptr)  
{  
    // custom free function  
}  
  
static void* MyRealloc(void* ptr, size_t size)  
{  
    // custom realloc function  
}  
  
// Register custom memory functions with wolfSSL  
int ret = wolfSSL_SetAllocators(MyMalloc, MyFree, MyRealloc);  
if (ret != 0) {  
    // failed to set memory functions  
}
```

17.2.2.5 function wolfSSL_StaticBufferSz

```
WOLFSSL_API int wolfSSL_StaticBufferSz(  
    byte * buffer,  
    word32 sz,  
    int flag  
)
```

This function is available when static memory feature is used (`-enable-staticmemory`). It gives the optimum buffer size for memory “buckets”. This allows for a way to compute buffer size so that no extra unused memory is left at the end after it has been partitioned. The returned value, if positive, is the computed buffer size to use.

Parameters:

- **buffer** pointer to buffer
- **size** size of buffer
- **type** desired type of memory ie `WOLFMEM_GENERAL` or `WOLFMEM_IO_POOL`

See:

- `wolfSSL_Malloc`
- `wolfSSL_Free`

Return:

- Success On successfully completing buffer size calculations a positive value is returned. This returned value is for optimum buffer size.
- Failure All negative values are considered to be error cases.

Example

```
byte buffer[1000];
word32 size = sizeof(buffer);
int optimum;
optimum = wolfSSL_StaticBufferSz(buffer, size, WOLFMEM_GENERAL);
if (optimum < 0) { //handle error case }
printf("The optimum buffer size to make use of all memory is %d\n",
optimum);
...
```

17.2.2.6 function `wolfSSL_MemoryPaddingSz`

```
WOLFSSL_API int wolfSSL_MemoryPaddingSz(
    void
)
```

This function is available when static memory feature is used (`-enable-staticmemory`). It gives the size of padding needed for each partition of memory. This padding size will be the size needed to contain a memory management structure along with any extra for memory alignment.

Parameters:

- **none** No parameters.

See:

- `wolfSSL_Malloc`
- `wolfSSL_Free`

Return:

- On successfully memory padding calculation the return value will be a positive value
- All negative values are considered error cases.

Example

```
int padding;
padding = wolfSSL_MemoryPaddingSz();
if (padding < 0) { //handle error case }
printf("The padding size needed for each \"bucket\" of memory is %d\n",
```

```
padding);
// calculation of buffer for IO POOL size is number of buckets
// times (padding + WOLFMEM_IO_SZ)
...
```

17.2.2.7 function XMALLOC

```
WOLFSSL_API void * XMALLOC(
    size_t n,
    void * heap,
    int type
)
```

This is not actually a function, but rather a preprocessor macro, which allows the user to substitute in their own malloc, realloc, and free functions in place of the standard C memory functions. To use external memory functions, define XMALLOC_USER. This will cause the memory functions to be replaced by external functions of the form: extern void XMALLOC(size_t n, void heap, int type); extern void XREALLOC(void *p, size_t n, void heap, int type); extern void XFREE(void p, void heap, int type); To use the basic C memory functions in place of wolfSSL_Malloc, wolfSSL_Realloc, wolfSSL_Free, define NO_WOLFSSL_MEMORY. This will replace the memory functions with: #define XMALLOC(s, h, t)((void)h, (void)t, malloc((s))) #define XFREE(p, h, t){void* xp = (p); if((xp)) free((xp));} #define XREALLOC(p, n, h, t) realloc((p), (n)) If none of these options are selected, the system will default to use the wolfSSL memory functions. A user can set custom memory functions through callback hooks, (see wolfSSL_Malloc, wolfSSL_Realloc, wolfSSL_Free). This option will replace the memory functions with: #define XMALLOC(s, h, t)((void)h, (void)t, wolfSSL_Malloc((s))) #define XFREE(p, h, t){void* xp = (p); if((xp)) wolfSSL_Free((xp));} #define XREALLOC(p, n, h, t) wolfSSL_Realloc((p), (n))

Parameters:

- **s** size of memory to allocate
- **h** (used by custom XMALLOC function) pointer to the heap to use
- **t** memory allocation types for user hints. See enum in [types.h](#)

See:

- [wolfSSL_Malloc](#)
- [wolfSSL_Realloc](#)
- [wolfSSL_Free](#)
- [wolfSSL_SetAllocators](#)

Return:

- pointer Return a pointer to allocated memory on success
- NULL on failure

Example

```
int* tenInts = XMALLOC(sizeof(int)*10, NULL, DYNAMIC_TYPE_TMP_BUFFER);
if (tenInts == NULL) {
    // error allocating space
    return MEMORY_E;
}
```

17.2.2.8 function XREALLOC

```
WOLFSSL_API void * XREALLOC(
    void * p,
    size_t n,
    void * heap,
```

```

    int type
)

```

This is not actually a function, but rather a preprocessor macro, which allows the user to substitute in their own malloc, realloc, and free functions in place of the standard C memory functions. To use external memory functions, define `XMALLOC_USER`. This will cause the memory functions to be replaced by external functions of the form: `extern void XMALLOC(size_t n, void heap, int type);` `extern void XREALLOC(void *p, size_t n, void heap, int type);` `extern void XFREE(void p, void heap, int type);` To use the basic C memory functions in place of `wolfSSL_Malloc`, `wolfSSL_Realloc`, `wolfSSL_Free`, define `NO_WOLFSSL_MEMORY`. This will replace the memory functions with: `#define XMALLOC(s, h, t)((void)h, (void)t, malloc((s)))` `#define XFREE(p, h, t){void* xp = (p); if((xp)) free((xp));}` `#define XREALLOC(p, n, h, t) realloc((p), (n))` If none of these options are selected, the system will default to use the `wolfSSL` memory functions. A user can set custom memory functions through callback hooks, (see `wolfSSL_Malloc`, `wolfSSL_Realloc`, `wolfSSL_Free`). This option will replace the memory functions with: `#define XMALLOC(s, h, t)((void)h, (void)t, wolfSSL_Malloc((s)))` `#define XFREE(p, h, t){void* xp = (p); if((xp)) wolfSSL_Free((xp));}` `#define XREALLOC(p, n, h, t) wolfSSL_Realloc((p), (n))`

Parameters:

- **p** pointer to the address to reallocate
- **n** size of memory to allocate
- **h** (used by custom `XREALLOC` function) pointer to the heap to use
- **t** memory allocation types for user hints. See enum in [types.h](#)

See:

- [wolfSSL_Malloc](#)
- [wolfSSL_Realloc](#)
- [wolfSSL_Free](#)
- [wolfSSL_SetAllocators](#)

Return:

- Return a pointer to allocated memory on success
- NULL on failure

Example

```

int* tenInts = (int*)XMALLOC(sizeof(int)*10, NULL, DYNAMIC_TYPE_TMP_BUFFER);
int* twentyInts = (int*)XREALLOC(tenInts, sizeof(int)*20, NULL,
    DYNAMIC_TYPE_TMP_BUFFER);

```

17.2.2.9 function XFREE

```

WOLFSSL_API void XFREE(
    void * p,
    void * heap,
    int type
)

```

This is not actually a function, but rather a preprocessor macro, which allows the user to substitute in their own malloc, realloc, and free functions in place of the standard C memory functions. To use external memory functions, define `XMALLOC_USER`. This will cause the memory functions to be replaced by external functions of the form: `extern void XMALLOC(size_t n, void heap, int type);` `extern void XREALLOC(void *p, size_t n, void heap, int type);` `extern void XFREE(void p, void heap, int type);` To use the basic C memory functions in place of `wolfSSL_Malloc`, `wolfSSL_Realloc`, `wolfSSL_Free`, define `NO_WOLFSSL_MEMORY`. This will replace the memory functions with: `#define XMALLOC(s, h, t)((void)h, (void)t, malloc((s)))` `#define XFREE(p, h, t){void* xp = (p); if((xp)) free((xp));}` `#define XREALLOC(p, n, h, t) realloc((p), (n))` If none of these options are selected, the system will default to use the `wolfSSL` memory

functions. A user can set custom memory functions through callback hooks, (see `wolfSSL_Malloc`, `wolfSSL_Realloc`, `wolfSSL_Free`). This option will replace the memory functions with: `#define XMALLOC(s, h, t) ((void)h, (void)t, wolfSSL_Malloc((s))) #define XFREE(p, h, t) {void* xp = (p); if((xp)) wolfSSL_Free((xp));} #define XREALLOC(p, n, h, t) wolfSSL_Realloc((p), (n))`

Parameters:

- **p** pointer to the address to free
- **h** (used by custom `XFREE` function) pointer to the heap to use
- **t** memory allocation types for user hints. See enum in [types.h](#)

See:

- [wolfSSL_Malloc](#)
- [wolfSSL_Realloc](#)
- [wolfSSL_Free](#)
- [wolfSSL_SetAllocators](#)

Return: none No returns.

Example

```
int* tenInts = XMALLOC(sizeof(int) * 10, NULL, DYNAMIC_TYPE_TMP_BUFFER);
if (tenInts == NULL) {
    // error allocating space
    return MEMORY_E;
}
```

17.3.2 Functions Documentation

17.3.2.1 function wolfSSL_BN_mod_exp

```
WOLFSSL_API int wolfSSL_BN_mod_exp(
    WOLFSSL_BIGNUM * r,
    const WOLFSSL_BIGNUM * a,
    const WOLFSSL_BIGNUM * p,
    const WOLFSSL_BIGNUM * m,
    WOLFSSL_BN_CTX * ctx
)
```

This function performs the following math “ $r = (a^p) \% m$ ”.

Parameters:

- **r** structure to hold result.
- **a** value to be raised by a power.
- **p** power to raise a by.
- **m** modulus to use.
- **ctx** currently not used with wolfSSL can be NULL.

See:

- wolfSSL_BN_new
- wolfSSL_BN_free

Return:

- SSL_SUCCESS On successfully performing math operation.
- SSL_FAILURE If an error case was encountered.

Example

```
WOLFSSL_BIGNUM r,a,p,m;
int ret;
// set big number values
ret = wolfSSL_BN_mod_exp(r, a, p, m, NULL);
// check ret value
```

17.3.2.2 function wolfSSL_EVP_des_ede3_ecb

```
WOLFSSL_API const WOLFSSL_EVP_CIPHER * wolfSSL_EVP_des_ede3_ecb(
    void
)
```

Getter functions for the respective WOLFSSL_EVP_CIPHER pointers. wolfSSL_EVP_init() must be called once in the program first to populate these cipher strings. WOLFSSL_DES_ECB macro must be defined for wolfSSL_EVP_des_ede3_ecb().

Parameters:

- **none** No parameters.

See: wolfSSL_EVP_CIPHER_CTX_init

Return: pointer Returns a WOLFSSL_EVP_CIPHER pointer for DES EDE3 operations.

Example

```
printf("block size des ede3 cbc = %d\n",
wolfSSL_EVP_CIPHER_block_size(wolfSSL_EVP_des_ede3_cbc()));
printf("block size des ede3 ecb = %d\n",
wolfSSL_EVP_CIPHER_block_size(wolfSSL_EVP_des_ede3_ecb()));
```

17.3.2.3 function wolfSSL_EVP_des_cbc

```
WOLFSSL_API const WOLFSSL_EVP_CIPHER * wolfSSL_EVP_des_cbc(
    void
)
```

Getter functions for the respective WOLFSSL_EVP_CIPHER pointers. wolfSSL_EVP_init() must be called once in the program first to populate these cipher strings. WOLFSSL_DES_ECB macro must be defined for wolfSSL_EVP_des_ecb().

Parameters:

- **none** No parameters.

See: wolfSSL_EVP_CIPHER_CTX_init

Return: pointer Returns a WOLFSSL_EVP_CIPHER pointer for DES operations.

Example

```
WOLFSSL_EVP_CIPHER* cipher;
cipher = wolfSSL_EVP_des_cbc();
...
```

17.3.2.4 function wolfSSL_EVP_DigestInit_ex

```
WOLFSSL_API int wolfSSL_EVP_DigestInit_ex(
    WOLFSSL_EVP_MD_CTX * ctx,
    const WOLFSSL_EVP_MD * type,
    WOLFSSL_ENGINE * impl
)
```

Function for initializing WOLFSSL_EVP_MD_CTX. This function is a wrapper for wolfSSL_EVP_DigestInit() because wolfSSL does not use WOLFSSL_ENGINE.

Parameters:

- **ctx** structure to initialize.
- **type** type of hash to do, for example SHA.
- **impl** engine to use. N/A for wolfSSL, can be NULL.

See:

- wolfSSL_EVP_MD_CTX_new
- [wolfCrypt_Init](#)
- wolfSSL_EVP_MD_CTX_free

Return:

- SSL_SUCCESS If successfully set.
- SSL_FAILURE If not successful.

Example

```
WOLFSSL_EVP_MD_CTX* md = NULL;
wolfCrypt_Init();
md = wolfSSL_EVP_MD_CTX_new();
if (md == NULL) {
    printf("error setting md\n");
    return -1;
}
printf("cipher md init ret = %d\n", wolfSSL_EVP_DigestInit_ex(md,
wolfSSL_EVP_sha1(), e));
//free resources
```

17.3.2.5 function wolfSSL_EVP_CipherInit_ex

```
WOLFSSL_API int wolfSSL_EVP_CipherInit_ex(
    WOLFSSL_EVP_CIPHER_CTX * ctx,
    const WOLFSSL_EVP_CIPHER * type,
    WOLFSSL_ENGINE * impl,
    const unsigned char * key,
    const unsigned char * iv,
    int enc
)
```

Function for initializing WOLFSSL_EVP_CIPHER_CTX. This function is a wrapper for wolfSSL_CipherInit() because wolfSSL does not use WOLFSSL_ENGINE.

Parameters:

- **ctx** structure to initialize.
- **type** type of encryption/decryption to do, for example AES.
- **impl** engine to use. N/A for wolfSSL, can be NULL.
- **key** key to set .
- **iv** iv if needed by algorithm.
- **enc** encryption (1) or decryption (0) flag.

See:

- wolfSSL_EVP_CIPHER_CTX_new
- [wolfCrypt_Init](#)
- wolfSSL_EVP_CIPHER_CTX_free

Return:

- SSL_SUCCESS If successfully set.
- SSL_FAILURE If not successful.

Example

```
WOLFSSL_EVP_CIPHER_CTX* ctx = NULL;
WOLFSSL_ENGINE* e = NULL;
unsigned char key[16];
unsigned char iv[12];
wolfCrypt_Init();
ctx = wolfSSL_EVP_CIPHER_CTX_new();
if (ctx == NULL) {
    printf("issue creating ctx\n");
}
```

```

        return -1;
    }

    printf("cipher init ex error ret = %d\n", wolfSSL_EVP_CipherInit_ex(NULL,
    EVP_aes_128_cbc(), e, key, iv, 1));
    printf("cipher init ex success ret = %d\n", wolfSSL_EVP_CipherInit_ex(ctx,
    EVP_aes_128_cbc(), e, key, iv, 1));
    // free resources

```

17.3.2.6 function wolfSSL_EVP_EncryptInit_ex

```

WOLFSSL_API int wolfSSL_EVP_EncryptInit_ex(
    WOLFSSL_EVP_CIPHER_CTX * ctx,
    const WOLFSSL_EVP_CIPHER * type,
    WOLFSSL_ENGINE * impl,
    const unsigned char * key,
    const unsigned char * iv
)

```

Function for initializing WOLFSSL_EVP_CIPHER_CTX. This function is a wrapper for wolfSSL_EVP_CipherInit() because wolfSSL does not use WOLFSSL_ENGINE. Sets encrypt flag to be encrypt.

Parameters:

- **ctx** structure to initialize.
- **type** type of encryption to do, for example AES.
- **impl** engine to use. N/A for wolfSSL, can be NULL.
- **key** key to use.
- **iv** iv to use.

See:

- wolfSSL_EVP_CIPHER_CTX_new
- [wolfCrypt_Init](#)
- wolfSSL_EVP_CIPHER_CTX_free

Return:

- SSL_SUCCESS If successfully set.
- SSL_FAILURE If not successful.

Example

```

WOLFSSL_EVP_CIPHER_CTX* ctx = NULL;
wolfCrypt_Init();
ctx = wolfSSL_EVP_CIPHER_CTX_new();
if (ctx == NULL) {
    printf("error setting ctx\n");
    return -1;
}
printf("cipher ctx init ret = %d\n", wolfSSL_EVP_EncryptInit_ex(ctx,
wolfSSL_EVP_aes_128_cbc(), e, key, iv));
//free resources

```

17.3.2.7 function wolfSSL_EVP_CipherUpdate

```

WOLFSSL_API int wolfSSL_EVP_CipherUpdate(
    WOLFSSL_EVP_CIPHER_CTX * ctx,
    unsigned char * out,

```

```

    int * outl,
    const unsigned char * in,
    int inl
)

```

Function for encrypting/decrypting data. In buffer is added to be encrypted or decrypted and out buffer holds the results. outl will be the length of encrypted/decrypted information.

Parameters:

- **ctx** structure to get cipher type from.
- **out** buffer to hold output.
- **outl** adjusted to be size of output.
- **in** buffer to perform operation on.
- **inl** length of input buffer.

See:

- wolfSSL_EVP_CIPHER_CTX_new
- [wolfCrypt_Init](#)
- wolfSSL_EVP_CIPHER_CTX_free

Return:

- SSL_SUCCESS If successful.
- SSL_FAILURE If not successful.

Example

```

WOLFSSL_EVP_CIPHER_CTX* ctx = NULL;
unsigned char out[100];
int outl;
unsigned char in[100];
int inl = 100;

ctx = wolfSSL_EVP_CIPHER_CTX_new();
// set up ctx
ret = wolfSSL_EVP_CipherUpdate(ctx, out, outl, in, inl);
// check ret value
// buffer out holds outl bytes of data
// free resources

```

17.3.2.8 function wolfSSL_EVP_CipherFinal

```

WOLFSSL_API int wolfSSL_EVP_CipherFinal(
    WOLFSSL_EVP_CIPHER_CTX * ctx,
    unsigned char * out,
    int * outl
)

```

This function performs the final cipher operations adding in padding. If WOLFSSL_EVP_CIPH_NO_PADDING flag is set in WOLFSSL_EVP_CIPHER_CTX structure then 1 is returned and no encryption/decryption is done. If padding flag is set padding is added and encrypted when ctx is set to encrypt, padding values are checked when set to decrypt.

Parameters:

- **ctx** structure to decrypt/encrypt with.
- **out** buffer for final decrypt/encrypt.
- **out1** size of out buffer when data has been added by function.

See: wolfSSL_EVP_CIPHER_CTX_new

Return:

- 1 Returned on success.
- 0 If encountering a failure.

Example

```
WOLFSSL_EVP_CIPHER_CTX* ctx;
int out1;
unsigned char out[64];
// create ctx
wolfSSL_EVP_CipherFinal(ctx, out, &out1);
```

17.3.2.9 function wolfSSL_EVP_CIPHER_CTX_set_key_length

```
WOLFSSL_API int wolfSSL_EVP_CIPHER_CTX_set_key_length(
    WOLFSSL_EVP_CIPHER_CTX * ctx,
    int keylen
)
```

Setter function for WOLFSSL_EVP_CIPHER_CTX structure key length.

Parameters:

- **ctx** structure to set key length.
- **keylen** key length.

See: wolfSSL_EVP_CIPHER_flags

Return:

- SSL_SUCCESS If successfully set.
- SSL_FAILURE If failed to set key length.

Example

```
WOLFSSL_EVP_CIPHER_CTX* ctx;
int keylen;
// create ctx
wolfSSL_EVP_CIPHER_CTX_set_key_length(ctx, keylen);
```

17.3.2.10 function wolfSSL_EVP_CIPHER_CTX_block_size

```
WOLFSSL_API int wolfSSL_EVP_CIPHER_CTX_block_size(
    const WOLFSSL_EVP_CIPHER_CTX * ctx
)
```

This is a getter function for the ctx block size.

Parameters:

- **ctx** the cipher ctx to get block size of.

See: wolfSSL_EVP_CIPHER_block_size

Return: size Returns ctx->block_size.

Example

```
const WOLFSSL_CVP_CIPHER_CTX* ctx;
//set up ctx
printf("block size = %d\n", wolfSSL_EVP_CIPHER_CTX_block_size(ctx));
```

17.3.2.11 function wolfSSL_EVP_CIPHER_block_size

```
WOLFSSL_API int wolfSSL_EVP_CIPHER_block_size(  
    const WOLFSSL_EVP_CIPHER * cipher  
)
```

This is a getter function for the block size of cipher.

Parameters:

- **cipher** cipher to get block size of.

See: wolfSSL_EVP_aes_256_ctr

Return: size returns the block size.

Example

```
printf("block size = %d\n",  
wolfSSL_EVP_CIPHER_block_size(wolfSSL_EVP_aes_256_ecb()));
```

17.3.2.12 function wolfSSL_EVP_CIPHER_CTX_set_flags

```
WOLFSSL_API void wolfSSL_EVP_CIPHER_CTX_set_flags(  
    WOLFSSL_EVP_CIPHER_CTX * ctx,  
    int flags  
)
```

Setter function for WOLFSSL_EVP_CIPHER_CTX structure.

Parameters:

- **ctx** structure to set flag.
- **flag** flag to set in structure.

See: wolfSSL_EVP_CIPHER_flags

Return: none No returns.

Example

```
WOLFSSL_EVP_CIPHER_CTX* ctx;  
int flag;  
// create ctx  
wolfSSL_EVP_CIPHER_CTX_set_flags(ctx, flag);
```

17.3.2.13 function wolfSSL_EVP_CIPHER_CTX_clear_flags

```
WOLFSSL_API void wolfSSL_EVP_CIPHER_CTX_clear_flags(  
    WOLFSSL_EVP_CIPHER_CTX * ctx,  
    int flags  
)
```

Clearing function for WOLFSSL_EVP_CIPHER_CTX structure.

Parameters:

- **ctx** structure to clear flag.
- **flag** flag value to clear in structure.

See: wolfSSL_EVP_CIPHER_flags

Return: none No returns.

Example

```
WOLFSSL_EVP_CIPHER_CTX* ctx;
int flag;
// create ctx
wolfSSL_EVP_CIPHER_CTX_clear_flags(ctx, flag);
```

17.3.2.14 function wolfSSL_EVP_CIPHER_CTX_set_padding

```
WOLFSSL_API int wolfSSL_EVP_CIPHER_CTX_set_padding(
    WOLFSSL_EVP_CIPHER_CTX * c,
    int pad
)
```

Setter function for WOLFSSL_EVP_CIPHER_CTX structure to use padding.

Parameters:

- **ctx** structure to set padding flag.
- **padding** 0 for not setting padding, 1 for setting padding.

See: wolfSSL_EVP_CIPHER_flags

Return:

- SSL_SUCCESS If successfully set.
- BAD_FUNC_ARG If null argument passed in.

Example

```
WOLFSSL_EVP_CIPHER_CTX* ctx;
// create ctx
wolfSSL_EVP_CIPHER_CTX_set_padding(ctx, 1);
```

17.3.2.15 function wolfSSL_PEM_write_bio_PrivateKey

```
WOLFSSL_API int wolfSSL_PEM_write_bio_PrivateKey(
    WOLFSSL_BIO * bio,
    WOLFSSL_EVP_PKEY * key,
    const WOLFSSL_EVP_CIPHER * cipher,
    unsigned char * passwd,
    int len,
    wc_pem_password_cb * cb,
    void * arg
)
```

This function writes a key into a WOLFSSL_BIO structure in PEM format.

Parameters:

- **bio** WOLFSSL_BIO structure to get PEM buffer from.
- **key** key to convert to PEM format.
- **cipher** EVP cipher structure.
- **passwd** password.
- **len** length of password.
- **cb** password callback.
- **arg** optional argument.

See: wolfSSL_PEM_read_bio_X509_AUX

Return:

- SSL_SUCCESS upon success.

- SSL_FAILURE upon failure.

Example

```
WOLFSSL_BIO* bio;
WOLFSSL_EVP_PKEY* key;
int ret;
// create bio and setup key
ret = wolfSSL_PEM_write_bio_PrivateKey(bio, key, NULL, NULL, 0, NULL, NULL);
//check ret value
```

17.3.2.16 function wolfSSL_CTX_use_RSAPrivateKey_file

```
WOLFSSL_API int wolfSSL_CTX_use_RSAPrivateKey_file(
    WOLFSSL_CTX *,
    const char *,
    int
)
```

This function loads the private RSA key used in the SSL connection into the SSL context (WOLFSSL_CTX). This function is only available when wolfSSL has been compiled with the OpenSSL compatibility layer enabled (-enable-opensslExtra, #define OPENSSL_EXTRA), and is identical to the more-typically used [wolfSSL_CTX_use_PrivateKey_file\(\)](#) function. The file argument contains a pointer to the RSA private key file, in the format specified by format.

Parameters:

- **ctx** a pointer to a WOLFSSL_CTX structure, created using [wolfSSL_CTX_new\(\)](#)
- **file** a pointer to the name of the file containing the RSA private key to be loaded into the wolfSSL SSL context, with format as specified by format.
- **format** the encoding type of the RSA private key specified by file. Possible values include SSL_FILETYPE_PEM and SSL_FILETYPE_ASN1.

See:

- [wolfSSL_CTX_use_PrivateKey_buffer](#)
- [wolfSSL_CTX_use_PrivateKey_file](#)
- [wolfSSL_use_RSAPrivateKey_file](#)
- [wolfSSL_use_PrivateKey_buffer](#)
- [wolfSSL_use_PrivateKey_file](#)

Return:

- SSL_SUCCESS upon success.
- SSL_FAILURE If the function call fails, possible causes might include: The input key file is in the wrong format, or the wrong format has been given using the “format” argument, file doesn’t exist, can’t be read, or is corrupted, an out of memory condition occurs.

Example

```
int ret = 0;
WOLFSSL_CTX* ctx;
...
ret = wolfSSL_CTX_use_RSAPrivateKey_file(ctx, "../server-key.pem",
                                         SSL_FILETYPE_PEM);
if (ret != SSL_SUCCESS) {
    // error loading private key file
}
...
```

17.3.2.17 function wolfSSL_use_certificate_file

```
WOLFSSL_API int wolfSSL_use_certificate_file(  
    WOLFSSL * ,  
    const char * ,  
    int  
)
```

This function loads a certificate file into the SSL session (WOLFSSL structure). The certificate file is provided by the file argument. The format argument specifies the format type of the file - either SSL_FILETYPE_ASN1 or SSL_FILETYPE_PEM.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created with [wolfSSL_new\(\)](#).
- **file** a pointer to the name of the file containing the certificate to be loaded into the wolfSSL SSL session, with format as specified by format.
- **format** the encoding type of the certificate specified by file. Possible values include SSL_FILETYPE_PEM and SSL_FILETYPE_ASN1.

See:

- [wolfSSL_CTX_use_certificate_buffer](#)
- [wolfSSL_CTX_use_certificate_file](#)
- [wolfSSL_use_certificate_buffer](#)

Return:

- SSL_SUCCESS upon success
- SSL_FAILURE If the function call fails, possible causes might include: The file is in the wrong format, or the wrong format has been given using the "format" argument, file doesn't exist, can't be read, or is corrupted, an out of memory condition occurs, Base16 decoding fails on the file

Example

```
int ret = 0;  
WOLFSSL* ssl;  
...  
ret = wolfSSL_use_certificate_file(ssl, "../client-cert.pem",  
                                SSL_FILETYPE_PEM);  
if (ret != SSL_SUCCESS) {  
    // error loading cert file  
}  
...
```

17.3.2.18 function wolfSSL_use_PrivateKey_file

```
WOLFSSL_API int wolfSSL_use_PrivateKey_file(  
    WOLFSSL * ,  
    const char * ,  
    int  
)
```

This function loads a private key file into the SSL session (WOLFSSL structure). The key file is provided by the file argument. The format argument specifies the format type of the file - SSL_FILETYPE_ASN1 or SSL_FILETYPE_PEM.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created with [wolfSSL_new\(\)](#).

- **file** a pointer to the name of the file containing the key file to be loaded into the wolfSSL SSL session, with format as specified by format.
- **format** the encoding type of the key specified by file. Possible values include SSL_FILETYPE_PEM and SSL_FILETYPE_ASN1.

See:

- [wolfSSL_CTX_use_PrivateKey_buffer](#)
- [wolfSSL_CTX_use_PrivateKey_file](#)
- [wolfSSL_use_PrivateKey_buffer](#)
- [wc_CryptoCb_RegisterDevice](#)
- [wolfSSL_SetDevId](#)

Return:

- SSL_SUCCESS upon success.
- SSL_FAILURE If the function call fails, possible causes might include: The file is in the wrong format, or the wrong format has been given using the “format” argument, The file doesn’t exist, can’t be read, or is corrupted, An out of memory condition occurs, Base16 decoding fails on the file, The key file is encrypted but no password is provided

If using an external key store and do not have the private key you can instead provide the public key and register the crypto callback to handle the signing. For this you can build with either build with crypto callbacks or PK callbacks. To enable crypto callbacks use `-enable-cryptocb` or `WOLF_CRYPTO_CB` and register a crypto callback using `wc_CryptoCb_RegisterDevice` and set the associated devId using `wolfSSL_SetDevId`.

Example

```
int ret = 0;
WOLFSSL* ssl;
...
ret = wolfSSL_use_PrivateKey_file(ssl, "../server-key.pem",
                                SSL_FILETYPE_PEM);
if (ret != SSL_SUCCESS) {
    // error loading key file
}
...
```

17.3.2.19 function `wolfSSL_use_certificate_chain_file`

```
WOLFSSL_API int wolfSSL_use_certificate_chain_file(
    WOLFSSL *,
    const char * file
)
```

This function loads a chain of certificates into the SSL session (WOLFSSL structure). The file containing the certificate chain is provided by the file argument, and must contain PEM-formatted certificates. This function will process up to MAX_CHAIN_DEPTH (default = 9, defined in internal.h) certificates, plus the subject certificate.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using [wolfSSL_new\(\)](#)
- **file** a pointer to the name of the file containing the chain of certificates to be loaded into the wolfSSL SSL session. Certificates must be in PEM format.

See:

- [wolfSSL_CTX_use_certificate_chain_file](#)

- `wolfSSL_CTX_use_certificate_chain_buffer`
- `wolfSSL_use_certificate_chain_buffer`

Return:

- `SSL_SUCCESS` upon success.
- `SSL_FAILURE` If the function call fails, possible causes might include: The file is in the wrong format, or the wrong format has been given using the “format” argument, file doesn’t exist, can’t be read, or is corrupted, an out of memory condition occurs

Example

```
int ret = 0;
WOLFSSL* ctx;
...
ret = wolfSSL_use_certificate_chain_file(ssl, "./cert-chain.pem");
if (ret != SSL_SUCCESS) {
    // error loading cert file
}
...
```

17.3.2.20 function `wolfSSL_use_RSAPrivateKey_file`

```
WOLFSSL_API int wolfSSL_use_RSAPrivateKey_file(
    WOLFSSL * ,
    const char * ,
    int
)
```

This function loads the private RSA key used in the SSL connection into the SSL session (WOLFSSL structure). This function is only available when wolfSSL has been compiled with the OpenSSL compatibility layer enabled (`-enable-opensslExtra`, `#define OPENSSL_EXTRA`), and is identical to the more-typically used `wolfSSL_use_PrivateKey_file()` function. The file argument contains a pointer to the RSA private key file, in the format specified by format.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using `wolfSSL_new()`
- **file** a pointer to the name of the file containing the RSA private key to be loaded into the wolfSSL SSL session, with format as specified by format. \parm format the encoding type of the RSA private key specified by file. Possible values include `SSL_FILETYPE_PEM` and `SSL_FILETYPE_ASN1`.

See:

- `wolfSSL_CTX_use_RSAPrivateKey_file`
- `wolfSSL_CTX_use_PrivateKey_buffer`
- `wolfSSL_CTX_use_PrivateKey_file`
- `wolfSSL_use_PrivateKey_buffer`
- `wolfSSL_use_PrivateKey_file`

Return:

- `SSL_SUCCESS` upon success
- `SSL_FAILURE` If the function call fails, possible causes might include: The input key file is in the wrong format, or the wrong format has been given using the “format” argument, file doesn’t exist, can’t be read, or is corrupted, an out of memory condition occurs

Example

```
int ret = 0;
WOLFSSL* ssl;
```

```

...
ret = wolfSSL_use_RSAPrivateKey_file(ssl, "./server-key.pem",
                                     SSL_FILETYPE_PEM);
if (ret != SSL_SUCCESS) {
    // error loading private key file
}
...

```

17.3.2.21 function `wolfSSL_set_tlsext_status_type`

```

WOLFSSL_API long wolfSSL_set_tlsext_status_type(
    WOLFSSL * s,
    int type
)

```

This function is called when the client application request that a server send back an OCSP status response (also known as OCSP stapling). Currently, the only supported type is `TLSEXT_STATUSTYPE_ocsp`.

Parameters:

- **s** pointer to WolfSSL struct which is created by `SSL_new()` function
- **type** ssl extension type which `TLSEXT_STATUSTYPE_ocsp` is only supported.

See:

- `wolfSSL_new`
- `wolfSSL_CTX_new`
- `wolfSSL_free`
- `wolfSSL_CTX_free`

Return:

- 1 upon success.
- 0 upon error.

Example

```

WOLFSSL *ssl;
WOLFSSL_CTX *ctx;
int ret;
ctx = wolfSSL_CTX_new(wolfSSLv23_server_method());
ssl = wolfSSL_new(ctx);
ret = WolfSSL_set_tlsext_status_type(ssl, TLSEXT_STATUSTYPE_ocsp);
wolfSSL_free(ssl);
wolfSSL_CTX_free(ctx);

```

17.3.2.22 function `wolfSSL_get_peer_chain`

```

WOLFSSL_API WOLFSSL_X509_CHAIN * wolfSSL_get_peer_chain(
    WOLFSSL * ssl
)

```

Retrieves the peer's certificate chain.

Parameters:

- **ssl** pointer to a valid WOLFSSL structure.

See:

- `wolfSSL_get_chain_count`

- [wolfSSL_get_chain_length](#)
- [wolfSSL_get_chain_cert](#)
- [wolfSSL_get_chain_cert_pem](#)

Return:

- chain If successful the call will return the peer's certificate chain.
- 0 will be returned if an invalid WOLFSSL pointer is passed to the function.

Example

none

17.3.2.23 function `wolfSSL_get_chain_count`

```
WOLFSSL_API int wolfSSL_get_chain_count(
    WOLFSSL_X509_CHAIN * chain
)
```

Retrieve's the peers certificate chain count.

Parameters:

- **chain** pointer to a valid WOLFSSL_X509_CHAIN structure.

See:

- [wolfSSL_get_peer_chain](#)
- [wolfSSL_get_chain_length](#)
- [wolfSSL_get_chain_cert](#)
- [wolfSSL_get_chain_cert_pem](#)

Return:

- Success If successful the call will return the peer's certificate chain count.
- 0 will be returned if an invalid chain pointer is passed to the function.

Example

none

17.3.2.24 function `wolfSSL_get_chain_length`

```
WOLFSSL_API int wolfSSL_get_chain_length(
    WOLFSSL_X509_CHAIN * ,
    int idx
)
```

Retrieves the peer's ASN1.DER certificate length in bytes at index (idx).

Parameters:

- **chain** pointer to a valid WOLFSSL_X509_CHAIN structure.
- **idx** index to start of chain.

See:

- [wolfSSL_get_peer_chain](#)
- [wolfSSL_get_chain_count](#)
- [wolfSSL_get_chain_cert](#)
- [wolfSSL_get_chain_cert_pem](#)

Return:

- Success If successful the call will return the peer's certificate length in bytes by index.
- 0 will be returned if an invalid chain pointer is passed to the function.

Example

none

17.3.2.25 function `wolfSSL_get_chain_cert`

```
WOLFSSL_API unsigned char * wolfSSL_get_chain_cert(
    WOLFSSL_X509_CHAIN * ,
    int idx
)
```

Retrieves the peer's ASN1.DER certificate at index (idx).

Parameters:

- **chain** pointer to a valid WOLFSSL_X509_CHAIN structure.
- **idx** index to start of chain.

See:

- [wolfSSL_get_peer_chain](#)
- [wolfSSL_get_chain_count](#)
- [wolfSSL_get_chain_length](#)
- [wolfSSL_get_chain_cert_pem](#)

Return:

- Success If successful the call will return the peer's certificate by index.
- 0 will be returned if an invalid chain pointer is passed to the function.

Example

none

17.3.2.26 function `wolfSSL_get_chain_cert_pem`

```
WOLFSSL_API int wolfSSL_get_chain_cert_pem(
    WOLFSSL_X509_CHAIN * ,
    int idx,
    unsigned char * buf,
    int inLen,
    int * outLen
)
```

Retrieves the peer's PEM certificate at index (idx).

Parameters:

- **chain** pointer to a valid WOLFSSL_X509_CHAIN structure.
- **idx** index to start of chain.

See:

- [wolfSSL_get_peer_chain](#)
- [wolfSSL_get_chain_count](#)
- [wolfSSL_get_chain_length](#)
- [wolfSSL_get_chain_cert](#)

Return:

- Success If successful the call will return the peer's certificate by index.
- 0 will be returned if an invalid chain pointer is passed to the function.

Example

none

17.3.2.27 function wolfSSL_get_sessionID

```
WOLFSSL_API const unsigned char * wolfSSL_get_sessionID(
    const WOLFSSL_SESSION * s
)
```

Retrieves the session's ID. The session ID is always 32 bytes long.

Parameters:

- **session** pointer to a valid wolfssl session.

See: SSL_get_session

Return: id The session ID.

Example

none

17.3.2.28 function wolfSSL_X509_get_serial_number

```
WOLFSSL_API int wolfSSL_X509_get_serial_number(
    WOLFSSL_X509 * ,
    unsigned char * ,
    int *
)
```

Retrieves the peer's certificate serial number. The serial number buffer (in) should be at least 32 bytes long and be provided as the *inOutSz argument as input. After calling the function *inOutSz will hold the actual length in bytes written to the in buffer.

Parameters:

- **in** The serial number buffer and should be at least 32 bytes long
- **inOutSz** will hold the actual length in bytes written to the in buffer.

See: SSL_get_peer_certificate

Return:

- SSL_SUCCESS upon success.
- BAD_FUNC_ARG will be returned if a bad function argument was encountered.

Example

none

17.3.2.29 function wolfSSL_d2i_PKCS12_bio

```
WOLFSSL_API WC_PKCS12 * wolfSSL_d2i_PKCS12_bio(
    WOLFSSL_BIO * bio,
    WC_PKCS12 ** pkcs12
)
```

wolfSSL_d2i_PKCS12_bio(d2i_PKCS12_bio) copies in the PKCS12 information from WOLFSSL_BIO to the structure WC_PKCS12. The information is divided up in the structure as a list of Content Infos along with a structure to hold optional MAC information. After the information has been divided into chunks (but not decrypted) in the structure WC_PKCS12, it can then be parsed and decrypted by calling.

Parameters:

- **bio** WOLFSSL_BIO structure to read PKCS12 buffer from.
- **pkcs12** WC_PKCS12 structure pointer for new PKCS12 structure created. Can be NULL

See:

- [wolfSSL_PKCS12_parse](#)
- [wc_PKCS12_free](#)

Return:

- WC_PKCS12 pointer to a WC_PKCS12 structure.
- Failure If function failed it will return NULL.

Example

```
WC_PKCS12* pkcs;
WOLFSSL_BIO* bio;
WOLFSSL_X509* cert;
WOLFSSL_EVP_PKEY* pkey;
STACK_OF(X509) certs;
//bio loads in PKCS12 file
wolfSSL_d2i_PKCS12_bio(bio, &pkcs);
wolfSSL_PKCS12_parse(pkcs, "a password", &pkey, &cert, &certs)
wc_PKCS12_free(pkcs)
//use cert, pkey, and optionally certs stack
```

17.3.2.30 function wolfSSL_i2d_PKCS12_bio

```
WOLFSSL_API WC_PKCS12 * wolfSSL_i2d_PKCS12_bio(
    WOLFSSL_BIO * bio,
    WC_PKCS12 * pkcs12
)
```

wolfSSL_i2d_PKCS12_bio(i2d_PKCS12_bio) copies in the cert information from the structure WC_PKCS12 to WOLFSSL_BIO.

Parameters:

- **bio** WOLFSSL_BIO structure to write PKCS12 buffer to.
- **pkcs12** WC_PKCS12 structure for PKCS12 structure as input.

See:

- [wolfSSL_PKCS12_parse](#)
- [wc_PKCS12_free](#)

Return:

- 1 for success.
- Failure 0.

Example

```
WC_PKCS12 pkcs12;
FILE *f;
byte buffer[5300];
```

```

char file[] = "./test.p12";
int bytes;
WOLFSSL_BIO* bio;
pkcs12 = wc_PKCS12_new();
f = fopen(file, "rb");
bytes = (int)fread(buffer, 1, sizeof(buffer), f);
fclose(f);
//convert the DER file into an internal structure
wc_d2i_PKCS12(buffer, bytes, pkcs12);
bio = wolfSSL_BIO_new(wolfSSL_BIO_s_mem());
//convert PKCS12 structure into bio
wolfSSL_i2d_PKCS12_bio(bio, pkcs12);
wc_PKCS12_free(pkcs)
//use bio

```

17.3.2.31 function wolfSSL_PKCS12_parse

```

WOLFSSL_API int wolfSSL_PKCS12_parse(
    WC_PKCS12 * pkcs12,
    const char * psw,
    WOLFSSL_EVP_PKEY ** pkey,
    WOLFSSL_X509 ** cert,
    WOLF_STACK_OF(WOLFSSL_X509) ** ca
)

```

PKCS12 can be enabled with adding `-enable-opensslextra` to the configure command. It can use triple DES and RC4 for decryption so would recommend also enabling these features when enabling `opensslextra` (`-enable-des3 -enable-arc4`). `wolfSSL` does not currently support RC2 so decryption with RC2 is currently not available. This may be noticeable with default encryption schemes used by OpenSSL command line to create .p12 files. `wolfSSL_PKCS12_parse` (PKCS12_parse). The first thing this function does is check the MAC is correct if present. If the MAC fails then the function returns and does not try to decrypt any of the stored Content Infos. This function then parses through each Content Info looking for a bag type, if the bag type is known it is decrypted as needed and either stored in the list of certificates being built or as a key found. After parsing through all bags the key found is then compared with the certificate list until a matching pair is found. This matching pair is then returned as the key and certificate, optionally the certificate list found is returned as a `STACK_OF` certificates. At the moment a CRL, Secret or SafeContents bag will be skipped over and not parsed. It can be seen if these or other "Unknown" bags are skipped over by viewing the debug print out. Additional attributes such as friendly name are skipped over when parsing a PKCS12 file.

Parameters:

- **pkcs12** WC_PKCS12 structure to parse.
- **pswd** password for decrypting PKCS12.
- **pkey** structure to hold private key decoded from PKCS12.
- **cert** structure to hold certificate decoded from PKCS12.
- **stack** optional stack of extra certificates.

See:

- `wolfSSL_d2i_PKCS12_bio`
- `wc_PKCS12_free`

Return:

- `SSL_SUCCESS` On successfully parsing PKCS12.
- `SSL_FAILURE` If an error case was encountered.

Example

```
WC_PKCS12* pkcs;  
WOLFSSL_BIO* bio;  
WOLFSSL_X509* cert;  
WOLFSSL_EVP_PKEY* pkey;  
STACK_OF(X509) certs;  
//bio loads in PKCS12 file  
wolfSSL_d2i_PKCS12_bio(bio, &pkcs);  
wolfSSL_PKCS12_parse(pkcs, "a password", &pkey, &cert, &certs)  
wc_PKCS12_free(pkcs)  
//use cert, pkey, and optionally certs stack
```

17.4.2 Functions Documentation

17.4.2.1 function wc_KeyPemToDer

```
WOLFSSL_API int wc_KeyPemToDer(
    const unsigned char * ,
    int ,
    unsigned char * ,
    int ,
    const char *
)
```

Converts a key in PEM format to DER format.

Parameters:

- **pem** a pointer to the PEM encoded certificate.
- **pemSz** the size of the PEM buffer (pem)
- **buff** a pointer to the copy of the buffer member of the DerBuffer struct.
- **buffSz** size of the buffer space allocated in the DerBuffer struct.
- **pass** password passed into the function.

See: wc_PemToDer

Return:

- int the function returns the number of bytes written to the buffer on successful execution.
- int negative int returned indicating an error.

Example

```
byte* loadBuf;
long fileSz = 0;
byte* bufSz;
static int LoadKeyFile(byte** keyBuf, word32* keyBufSz,
    const char* keyFile,
        int typeKey, const char* password);
...
bufSz = wc_KeyPemToDer(loadBuf, (int)fileSz, saveBuf,
    (int)fileSz, password);

if(saveBufSz > 0){
    // Bytes were written to the buffer.
}
```

17.4.2.2 function wc_CertPemToDer

```
WOLFSSL_API int wc_CertPemToDer(
    const unsigned char * ,
    int ,
    unsigned char * ,
    int ,
    int
)
```

This function converts a PEM formatted certificate to DER format. Calls OpenSSL function PemToDer.

Parameters:

- **pem** pointer PEM formatted certificate.
- **pemSz** size of the certificate.
- **buff** buffer to be copied to DER format.
- **buffSz** size of the buffer.
- **type** Certificate file type found in [asn_public.h](#) enum CertType.

See: `wc_PemToDer`

Return: buffer returns the bytes written to the buffer.

Example

```
const unsigned char* pem;
int pemSz;
unsigned char buff[BUFSIZE];
int buffSz = sizeof(buff)/sizeof(char);
int type;
...
if(wc_CertPemToDer(pem, pemSz, buff, buffSz, type) <= 0) {
    // There were bytes written to buffer
}
```

17.4.2.3 function `wolfSSL_CTX_use_certificate_file`

```
WOLFSSL_API int wolfSSL_CTX_use_certificate_file(
    WOLFSSL_CTX *,
    const char *,
    int
)
```

This function loads a certificate file into the SSL context (`WOLFSSL_CTX`). The file is provided by the file argument. The format argument specifies the format type of the file, either `SSL_FILETYPE_ASN1` or `SSL_FILETYPE_PEM`. Please see the examples for proper usage.

Parameters:

- **ctx** a pointer to a `WOLFSSL_CTX` structure, created using `wolfSSL_CTX_new()`
- **file** a pointer to the name of the file containing the certificate to be loaded into the wolfSSL SSL context.
- **format** - format of the certificates pointed to by file. Possible options are `SSL_FILETYPE_ASN1` or `SSL_FILETYPE_PEM`.

See:

- `wolfSSL_CTX_use_certificate_buffer`
- `wolfSSL_use_certificate_file`
- `wolfSSL_use_certificate_buffer`

Return:

- `SSL_SUCCESS` upon success.
- `SSL_FAILURE` If the function call fails, possible causes might include the file is in the wrong format, or the wrong format has been given using the “format” argument, file doesn’t exist, can’t be read, or is corrupted, an out of memory condition occurs, Base16 decoding fails on the file.

Example

```
int ret = 0;
WOLFSSL_CTX* ctx;
...
ret = wolfSSL_CTX_use_certificate_file(ctx, "./client-cert.pem",
                                     SSL_FILETYPE_PEM);
if (ret != SSL_SUCCESS) {
    // error loading cert file
}
...
```

17.4.2.4 function wolfSSL_CTX_use_PrivateKey_file

```
WOLFSSL_API int wolfSSL_CTX_use_PrivateKey_file(
    WOLFSSL_CTX *,
    const char *,
    int
)
```

This function loads a private key file into the SSL context (WOLFSSL_CTX). The file is provided by the file argument. The format argument specifies the format type of the file - SSL_FILETYPE_ASN1 or SSL_FILETYPE_PEM. Please see the examples for proper usage.

Parameters:

- **none** No parameters.

See:

- [wolfSSL_CTX_use_PrivateKey_buffer](#)
- [wolfSSL_use_PrivateKey_file](#)
- [wolfSSL_use_PrivateKey_buffer](#)
- [wc_CryptoCb_RegisterDevice](#)
- [wolfSSL_CTX_SetDevId](#)

Return:

- SSL_SUCCESS upon success.
- SSL_FAILURE The file is in the wrong format, or the wrong format has been given using the “format” argument. The file doesn’t exist, can’t be read, or is corrupted. An out of memory condition occurs. Base16 decoding fails on the file. The key file is encrypted but no password is provided.

If using an external key store and do not have the private key you can instead provide the public key and register the crypto callback to handle the signing. For this you can build with either build with crypto callbacks or PK callbacks. To enable crypto callbacks use `-enable-cryptocb` or `WOLF_CRYPTO_CB` and register a crypto callback using `wc_CryptoCb_RegisterDevice` and set the associated devId using `wolfSSL_CTX_SetDevId`.

Example

```
int ret = 0;
WOLFSSL_CTX* ctx;
...
ret = wolfSSL_CTX_use_PrivateKey_file(ctx, "../server-key.pem",
                                     SSL_FILETYPE_PEM);
if (ret != SSL_SUCCESS) {
    // error loading key file
}
...
```

17.4.2.5 function wolfSSL_CTX_load_verify_locations

```
WOLFSSL_API int wolfSSL_CTX_load_verify_locations(
    WOLFSSL_CTX *,
    const char *,
    const char *
)
```

This function loads PEM-formatted CA certificate files into the SSL context (WOLFSSL_CTX). These certificates will be treated as trusted root certificates and used to verify certs received from peers during the SSL handshake. The root certificate file, provided by the file argument, may be a single certificate

or a file containing multiple certificates. If multiple CA certs are included in the same file, wolfSSL will load them in the same order they are presented in the file. The path argument is a pointer to the name of a directory that contains certificates of trusted root CAs. If the value of file is not NULL, path may be specified as NULL if not needed. If path is specified and NO_WOLFSSL_DIR was not defined when building the library, wolfSSL will load all CA certificates located in the given directory. This function will attempt to load all files in the directory. This function expects PEM formatted CERT_TYPE file with header "-----BEGIN CERTIFICATE-----".

Parameters:

- **ctx** pointer to the SSL context, created with `wolfSSL_CTX_new()`.
- **file** pointer to name of the file containing PEM-formatted CA certificates.
- **path** pointer to the name of a directory to load PEM-formatted certificates from.

See:

- `wolfSSL_CTX_load_verify_locations_ex`
- `wolfSSL_CTX_load_verify_buffer`
- `wolfSSL_CTX_use_certificate_file`
- `wolfSSL_CTX_use_PrivateKey_file`
- `wolfSSL_CTX_use_certificate_chain_file`
- `wolfSSL_use_certificate_file`
- `wolfSSL_use_PrivateKey_file`
- `wolfSSL_use_certificate_chain_file`

Return:

- SSL_SUCCESS up success.
- SSL_FAILURE will be returned if ctx is NULL, or if both file and path are NULL.
- SSL_BAD_FILETYPE will be returned if the file is the wrong format.
- SSL_BAD_FILE will be returned if the file doesn't exist, can't be read, or is corrupted.
- MEMORY_E will be returned if an out of memory condition occurs.
- ASN_INPUT_E will be returned if Base16 decoding fails on the file.
- ASN_BEFORE_DATE_E will be returned if the current date is before the before date.
- ASN_AFTER_DATE_E will be returned if the current date is after the after date.
- BUFFER_E will be returned if a chain buffer is bigger than the receiving buffer.
- BAD_PATH_ERROR will be returned if opendir() fails when trying to open path.

Example

```
int ret = 0;
WOLFSSL_CTX* ctx;
...
ret = wolfSSL_CTX_load_verify_locations(ctx, "./ca-cert.pem", NULL);
if (ret != WOLFSSL_SUCCESS) {
    // error loading CA certs
}
...
```

17.4.2.6 function `wolfSSL_CTX_load_verify_locations_ex`

```
WOLFSSL_API int wolfSSL_CTX_load_verify_locations_ex(
    WOLFSSL_CTX *,
    const char *,
    const char *,
    unsigned int flags
)
```

This function loads PEM-formatted CA certificate files into the SSL context (WOLFSSL_CTX). These certificates will be treated as trusted root certificates and used to verify certs received from peers during the SSL handshake. The root certificate file, provided by the file argument, may be a single certificate or a file containing multiple certificates. If multiple CA certs are included in the same file, wolfSSL will load them in the same order they are presented in the file. The path argument is a pointer to the name of a directory that contains certificates of trusted root CAs. If the value of file is not NULL, path may be specified as NULL if not needed. If path is specified and NO_WOLFSSL_DIR was not defined when building the library, wolfSSL will load all CA certificates located in the given directory. This function will attempt to load all files in the directory based on flags specified. This function expects PEM formatted CERT_TYPE files with header "-----BEGIN CERTIFICATE-----".

Parameters:

- **ctx** pointer to the SSL context, created with `wolfSSL_CTX_new()`.
- **file** pointer to name of the file containing PEM-formatted CA certificates.
- **path** pointer to the name of a directory to load PEM-formatted certificates from.
- **flags** possible mask values are: WOLFSSL_LOAD_FLAG_IGNORE_ERR, WOLFSSL_LOAD_FLAG_DATE_ERR_OKAY and WOLFSSL_LOAD_FLAG_PEM_CA_ONLY

See:

- `wolfSSL_CTX_load_verify_locations`
- `wolfSSL_CTX_load_verify_buffer`
- `wolfSSL_CTX_use_certificate_file`
- `wolfSSL_CTX_use_PrivateKey_file`
- `wolfSSL_CTX_use_certificate_chain_file`
- `wolfSSL_use_certificate_file`
- `wolfSSL_use_PrivateKey_file`
- `wolfSSL_use_certificate_chain_file`

Return:

- SSL_SUCCESS up success.
- SSL_FAILURE will be returned if ctx is NULL, or if both file and path are NULL. This will also be returned if at least one cert is loaded successfully but there is one or more that failed. Check error stack for reason.
- SSL_BAD_FILETYPE will be returned if the file is the wrong format.
- SSL_BAD_FILE will be returned if the file doesn't exist, can't be read, or is corrupted.
- MEMORY_E will be returned if an out of memory condition occurs.
- ASN_INPUT_E will be returned if Base16 decoding fails on the file.
- BUFFER_E will be returned if a chain buffer is bigger than the receiving buffer.
- BAD_PATH_ERROR will be returned if opendir() fails when trying to open path.

Example

```
int ret = 0;
WOLFSSL_CTX* ctx;
...
ret = wolfSSL_CTX_load_verify_locations_ex(ctx, NUULL, "../certs/external",
    WOLFSSL_LOAD_FLAG_PEM_CA_ONLY);
if (ret != WOLFSSL_SUCCESS) {
    // error loading CA certs
}
...
```

17.4.2.7 function wolfSSL_CTX_use_certificate_chain_file

```
WOLFSSL_API int wolfSSL_CTX_use_certificate_chain_file(
```

```

    WOLFSSL_CTX * ,
    const char * file
)

```

This function loads a chain of certificates into the SSL context (WOLFSSL_CTX). The file containing the certificate chain is provided by the file argument, and must contain PEM-formatted certificates. This function will process up to MAX_CHAIN_DEPTH (default = 9, defined in internal.h) certificates, plus the subject cert.

Parameters:

- **ctx** a pointer to a WOLFSSL_CTX structure, created using [wolfSSL_CTX_new\(\)](#)
- **file** a pointer to the name of the file containing the chain of certificates to be loaded into the wolfSSL SSL context. Certificates must be in PEM format.

See:

- [wolfSSL_CTX_use_certificate_file](#)
- [wolfSSL_CTX_use_certificate_buffer](#)
- [wolfSSL_use_certificate_file](#)
- [wolfSSL_use_certificate_buffer](#)

Return:

- SSL_SUCCESS upon success
- SSL_FAILURE If the function call fails, possible causes might include the file is in the wrong format, or the wrong format has been given using the “format” argument, file doesn’t exist, can’t be read, or is corrupted, an out of memory condition occurs.

Example

```

int ret = 0;
WOLFSSL_CTX* ctx;
...
ret = wolfSSL_CTX_use_certificate_chain_file(ctx, "../cert-chain.pem");
if (ret != SSL_SUCCESS) {
    // error loading cert file
}
...

```

17.4.2.8 function wolfSSL_CTX_der_load_verify_locations

```

WOLFSSL_API int wolfSSL_CTX_der_load_verify_locations(
    WOLFSSL_CTX * ,
    const char * ,
    int
)

```

This function is similar to [wolfSSL_CTX_load_verify_locations](#), but allows the loading of DER-formatted CA files into the SSL context (WOLFSSL_CTX). It may still be used to load PEM-formatted CA files as well. These certificates will be treated as trusted root certificates and used to verify certs received from peers during the SSL handshake. The root certificate file, provided by the file argument, may be a single certificate or a file containing multiple certificates. If multiple CA certs are included in the same file, wolfSSL will load them in the same order they are presented in the file. The format argument specifies the format which the certificates are in either, SSL_FILETYPE_PEM or SSL_FILETYPE_ASN1 (DER). Unlike [wolfSSL_CTX_load_verify_locations](#), this function does not allow the loading of CA certificates from a given directory path. Note that this function is only available when the wolfSSL library was compiled with WOLFSSL_DER_LOAD defined.

Parameters:

- **ctx** a pointer to a WOLFSSL_CTX structure, created using `wolfSSL_CTX_new()`
- **file** a pointer to the name of the file containing the CA certificates to be loaded into the wolfSSL SSL context, with format as specified by format.
- **format** the encoding type of the certificates specified by file. Possible values include SSL_FILETYPE_PEM and SSL_FILETYPE_ASN1.

See:

- `wolfSSL_CTX_load_verify_locations`
- `wolfSSL_CTX_load_verify_buffer`

Return:

- SSL_SUCCESS upon success.
- SSL_FAILURE upon failure.

Example

```
int ret = 0;
WOLFSSL_CTX* ctx;
...
ret = wolfSSL_CTX_der_load_verify_locations(ctx, "./ca-cert.der",
                                           SSL_FILETYPE_ASN1);
if (ret != SSL_SUCCESS) {
    // error loading CA certs
}
...
```

17.4.2.9 function `wolfSSL_SetCertCbCtx`

```
WOLFSSL_API void wolfSSL_SetCertCbCtx(
    WOLFSSL * ,
    void *
)
```

This function stores user CTX object information for verify callback.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using `wolfSSL_new()`.
- **ctx** a void pointer that is set to WOLFSSL structure's `verifyCbCtx` member's value.

See:

- `wolfSSL_CTX_save_cert_cache`
- `wolfSSL_CTX_restore_cert_cache`
- `wolfSSL_CTX_set_verify`

Return: none No return.

Example

```
WOLFSSL_CTX* ctx = wolfSSL_CTX_new( method );
WOLFSSL* ssl = wolfSSL_new(ctx);
(void*)ctx;
...
if(ssl != NULL){
    wolfSSL_SetCertCbCtx(ssl, ctx);
} else {
    // Error case, the SSL is not initialized properly.
}
```

17.4.2.10 function wolfSSL_CTX_save_cert_cache

```
WOLFSSL_API int wolfSSL_CTX_save_cert_cache(  
    WOLFSSL_CTX * ,  
    const char *  
)
```

This function writes the cert cache from memory to file.

Parameters:

- **ctx** a pointer to a WOLFSSL_CTX structure, holding the certificate information.
- **fname** the cert cache buffer.

See:

- CM_SaveCertCache
- DoMemSaveCertCache

Return:

- SSL_SUCCESS if CM_SaveCertCache exits normally.
- BAD_FUNC_ARG is returned if either of the arguments are NULL.
- SSL_BAD_FILE if the cert cache save file could not be opened.
- BAD_MUTEX_E if the lock mutex failed.
- MEMORY_E the allocation of memory failed.
- FWRITE_ERROR Certificate cache file write failed.

Example

```
WOLFSSL_CTX* ctx = WOLFSSL_CTX_new( protocol def );  
const char* fname;  
...  
if(wolfSSL_CTX_save_cert_cache(ctx, fname)){  
    // file was written.  
}
```

17.4.2.11 function wolfSSL_CTX_restore_cert_cache

```
WOLFSSL_API int wolfSSL_CTX_restore_cert_cache(  
    WOLFSSL_CTX * ,  
    const char *  
)
```

This function persists certificate cache from a file.

Parameters:

- **ctx** a pointer to a WOLFSSL_CTX structure, holding the certificate information.
- **fname** the cert cache buffer.

See:

- CM_RestoreCertCache
- XFOPEN

Return:

- SSL_SUCCESS returned if the function, CM_RestoreCertCache, executes normally.
- SSL_BAD_FILE returned if XFOPEN returns XBADFILE. The file is corrupted.
- MEMORY_E returned if the allocated memory for the temp buffer fails.
- BAD_FUNC_ARG returned if fname or ctx have a NULL value.

Example

```
WOLFSSL_CTX* ctx = wolfSSL_CTX_new( protocol method );
WOLFSSL* ssl = wolfSSL_new(ctx);
const char* fname = "path to file";
...
if(wolfSSL_CTX_restore_cert_cache(ctx, fname)){
    // check to see if the execution was successful
}
```

17.4.2.12 function wolfSSL_CTX_memsave_cert_cache

```
WOLFSSL_API int wolfSSL_CTX_memsave_cert_cache(
    WOLFSSL_CTX *,
    void *,
    int ,
    int *
)
```

This function persists the certificate cache to memory.

Parameters:

- **ctx** a pointer to a WOLFSSL_CTX structure, created using `wolfSSL_CTX_new()`.
- **mem** a void pointer to the destination (output buffer).
- **sz** the size of the output buffer.
- **used** a pointer to size of the cert cache header.

See:

- DoMemSaveCertCache
- GetCertCacheMemSize
- CM_MemRestoreCertCache
- CM_GetCertCacheMemSize

Return:

- SSL_SUCCESS returned on successful execution of the function. No errors were thrown.
- BAD_MUTEX_E mutex error where the WOLFSSL_CERT_MANAGER member caLock was not 0 (zero).
- BAD_FUNC_ARG returned if ctx, mem, or used is NULL or if sz is less than or equal to 0 (zero).
- BUFFER_E output buffer mem was too small.

Example

```
WOLFSSL_CTX* ctx = WOLFSSL_CTX_new( protocol );
void* mem;
int sz;
int* used;
...
if(wolfSSL_CTX_memsave_cert_cache(ctx, mem, sz, used) != SSL_SUCCESS){
    // The function returned with an error
}
```

17.4.2.13 function wolfSSL_CTX_get_cert_cache_memsize

```
WOLFSSL_API int wolfSSL_CTX_get_cert_cache_memsize(
    WOLFSSL_CTX *
)
```

Returns the size the certificate cache save buffer needs to be.

Parameters:

- **ctx** a pointer to a wolfSSL_CTX structure, created using `wolfSSL_CTX_new()`.

See: CM_GetCertCacheMemSize

Return:

- int integer value returned representing the memory size upon success.
- BAD_FUNC_ARG is returned if the WOLFSSL_CTX struct is NULL.
- BAD_MUTEX_E - returned if there was a mutex lock error.

Example

```
WOLFSSL_CTX* ctx = WOLFSSL_CTX_new(protocol);
...
int certCacheSize = wolfSSL_CTX_get_cert_cache_memsize(ctx);

if(certCacheSize != BAD_FUNC_ARG || certCacheSize != BAD_MUTEX_E){
    // Successfully retrieved the memory size.
}
```

17.4.2.14 function wolfSSL_X509_NAME_online

```
WOLFSSL_API char * wolfSSL_X509_NAME_online(
    WOLFSSL_X509_NAME * ,
    char * ,
    int
)
```

This function copies the name of the x509 into a buffer.

Parameters:

- **name** a pointer to a WOLFSSL_X509 structure.
- **in** a buffer to hold the name copied from the WOLFSSL_X509_NAME structure.
- **sz** the maximum size of the buffer.

See:

- `wolfSSL_X509_get_subject_name`
- `wolfSSL_X509_get_issuer_name`
- `wolfSSL_X509_get_isCA`
- `wolfSSL_get_peer_certificate`
- `wolfSSL_X509_version`

Return: A char pointer to the buffer with the WOLFSSL_X509_NAME structures name member's data is returned if the function executed normally.

Example

```
WOLFSSL_X509 x509;
char* name;
...
name = wolfSSL_X509_NAME_online(wolfSSL_X509_get_issuer_name(x509), 0, 0);

if(name <= 0){
    // There's nothing in the buffer.
}
```

17.4.2.15 function wolfSSL_X509_get_issuer_name

```
WOLFSSL_API WOLFSSL_X509_NAME * wolfSSL_X509_get_issuer_name(  
    WOLFSSL_X509 *  
)
```

This function returns the name of the certificate issuer.

Parameters:

- **cert** a pointer to a WOLFSSL_X509 structure.

See:

- [wolfSSL_X509_get_subject_name](#)
- [wolfSSL_X509_get_isCA](#)
- [wolfSSL_get_peer_certificate](#)
- [wolfSSL_X509_NAME_online](#)

Return:

- point a pointer to the WOLFSSL_X509 struct's issuer member is returned.
- NULL if the cert passed in is NULL.

Example

```
WOLFSSL_X509* x509;  
WOLFSSL_X509_NAME issuer;  
...  
issuer = wolfSSL_X509_NAME_online(wolfSSL_X509_get_issuer_name(x509), 0, 0);  
  
if(!issuer){  
    // NULL was returned  
} else {  
    // issuer holds the name of the certificate issuer.  
}
```

17.4.2.16 function wolfSSL_X509_get_subject_name

```
WOLFSSL_API WOLFSSL_X509_NAME * wolfSSL_X509_get_subject_name(  
    WOLFSSL_X509 *  
)
```

This function returns the subject member of the WOLFSSL_X509 structure.

Parameters:

- **cert** a pointer to a WOLFSSL_X509 structure.

See:

- [wolfSSL_X509_get_issuer_name](#)
- [wolfSSL_X509_get_isCA](#)
- [wolfSSL_get_peer_certificate](#)

Return: pointer a pointer to the WOLFSSL_X509_NAME structure. The pointer may be NULL if the WOLFSSL_X509 struct is NULL or if the subject member of the structure is NULL.

Example

```
WOLFSSL_X509* cert;  
WOLFSSL_X509_NAME name;  
...
```

```

name = wolfSSL_X509_get_subject_name(cert);
if(name == NULL){
    // Deal with the NULL cacse
}

```

17.4.2.17 function wolfSSL_X509_NAME_get_text_by_NID

```

WOLFSSL_API int wolfSSL_X509_NAME_get_text_by_NID(
    WOLFSSL_X509_NAME *,
    int ,
    char * ,
    int
)

```

This function gets the text related to the passed in NID value.

Parameters:

- **name** WOLFSSL_X509_NAME to search for text.
- **nid** NID to search for.
- **buf** buffer to hold text when found.
- **len** length of buffer.

See: none

Return: int returns the size of the text buffer.

Example

```

WOLFSSL_X509_NAME* name;
char buffer[100];
int bufferSz;
int ret;
// get WOLFSSL_X509_NAME
ret = wolfSSL_X509_NAME_get_text_by_NID(name, NID_commonName,
buffer, bufferSz);

//check ret value

```

17.4.2.18 function wolfSSL_X509_get_signature_type

```

WOLFSSL_API int wolfSSL_X509_get_signature_type(
    WOLFSSL_X509 *
)

```

This function returns the value stored in the sigOID member of the WOLFSSL_X509 structure.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using `wolfSSL_new()`.

See:

- `wolfSSL_X509_get_signature`
- `wolfSSL_X509_version`
- `wolfSSL_X509_get_der`
- `wolfSSL_X509_get_serial_number`
- `wolfSSL_X509_notBefore`
- `wolfSSL_X509_notAfter`
- `wolfSSL_X509_free`

Return:

- 0 returned if the WOLFSSL_X509 structure is NULL.
- int an integer value is returned which was retrieved from the x509 object.

Example

```
WOLFSSL_X509 x509 = (WOLFSSL_X509*)XMALLOC(sizeof(WOLFSSL_X509), NULL,
                                           DYNAMIC_TYPE_X509);

...
int x509SigType = wolfSSL_X509_get_signature_type(x509);

if(x509SigType != EXPECTED){
    // Deal with an unexpected value
}
```

17.4.2.19 function wolfSSL_X509_get_signature

```
WOLFSSL_API int wolfSSL_X509_get_signature(
    WOLFSSL_X509 *,
    unsigned char *,
    int *
)
```

Gets the X509 signature and stores it in the buffer.

Parameters:

- **x509** pointer to a WOLFSSL_X509 structure.
- **buf** a char pointer to the buffer.
- **bufSz** an integer pointer to the size of the buffer.

See:

- [wolfSSL_X509_get_serial_number](#)
- [wolfSSL_X509_get_signature_type](#)
- [wolfSSL_X509_get_device_type](#)

Return:

- SSL_SUCCESS returned if the function successfully executes. The signature is loaded into the buffer.
- SSL_FATAL_ERROR returns if the x509 struct or the bufSz member is NULL. There is also a check for the length member of the sig structure (sig is a member of x509).

Example

```
WOLFSSL_X509* x509 = (WOLFSSL_X509)XMALLOC(sizeof(WOLFSSL_X509), NULL,
                                           DYNAMIC_TYPE_X509);
unsigned char* buf; // Initialize
int* bufSz = sizeof(buf)/sizeof(unsigned char);
...
if(wolfSSL_X509_get_signature(x509, buf, bufSz) != SSL_SUCCESS){
    // The function did not execute successfully.
} else{
    // The buffer was written to correctly.
}
```

17.4.2.20 function wolfSSL_X509_STORE_add_cert

```
WOLFSSL_API int wolfSSL_X509_STORE_add_cert(
    WOLFSSL_X509_STORE * ,
    WOLFSSL_X509 *
)
```

This function adds a certificate to the WOLFSSL_X509_STORE structure.

Parameters:

- **str** certificate store to add the certificate to.
- **x509** certificate to add.

See: [wolfSSL_X509_free](#)

Return:

- SSL_SUCCESS If certificate is added successfully.
- SSL_FATAL_ERROR: If certificate is not added successfully.

Example

```
WOLFSSL_X509_STORE* str;
WOLFSSL_X509* x509;
int ret;
ret = wolfSSL_X509_STORE_add_cert(str, x509);
//check ret value
```

17.4.2.21 function wolfSSL_X509_STORE_CTX_get_chain

```
WOLFSSL_API WOLFSSL_STACK * wolfSSL_X509_STORE_CTX_get_chain(
    WOLFSSL_X509_STORE_CTX * ctx
)
```

This function is a getter function for chain variable in WOLFSSL_X509_STORE_CTX structure. Currently chain is not populated.

Parameters:

- **ctx** certificate store ctx to get parse chain from.

See: [wolfSSL_sk_X509_free](#)

Return:

- pointer if successful returns WOLFSSL_STACK (same as STACK_OF(WOLFSSL_X509)) pointer
- Null upon failure

Example

```
WOLFSSL_STACK* sk;
WOLFSSL_X509_STORE_CTX* ctx;
sk = wolfSSL_X509_STORE_CTX_get_chain(ctx);
//check sk for NULL and then use it. sk needs freed after done.
```

17.4.2.22 function wolfSSL_X509_STORE_set_flags

```
WOLFSSL_API int wolfSSL_X509_STORE_set_flags(
    WOLFSSL_X509_STORE * store,
    unsigned long flag
)
```

This function takes in a flag to change the behavior of the WOLFSSL_X509_STORE structure passed in. An example of a flag used is WOLFSSL_CRL_CHECK.

Parameters:

- **str** certificate store to set flag in.
- **flag** flag for behavior.

See:

- wolfSSL_X509_STORE_new
- wolfSSL_X509_STORE_free

Return:

- SSL_SUCCESS If no errors were encountered when setting the flag.
- <0 a negative value will be returned upon failure.

Example

```
WOLFSSL_X509_STORE* str;
int ret;
// create and set up str
ret = wolfSSL_X509_STORE_set_flags(str, WOLFSSL_CRL_CHECKALL);
If (ret != SSL_SUCCESS) {
    //check ret value and handle error case
}
```

17.4.2.23 function wolfSSL_X509_notBefore

```
WOLFSSL_API const byte * wolfSSL_X509_notBefore(
    WOLFSSL_X509 * x509
)
```

This function the certificate "not before" validity encoded as a byte array.

Parameters:

- **x509** pointer to a WOLFSSL_X509 structure.

See:

- wolfSSL_X509_get_signature
- wolfSSL_X509_version
- wolfSSL_X509_get_der
- wolfSSL_X509_get_serial_number
- wolfSSL_X509_notAfter
- wolfSSL_X509_free

Return:

- NULL returned if the WOLFSSL_X509 structure is NULL.
- byte is returned that contains the notBeforeData.

Example

```
WOLFSSL_X509* x509 = (WOLFSSL_X509*)XMALLOC(sizeof(WOLFSSL_X509), NULL,
    DYNAMIC_TYPE_X509);
...
byte* notBeforeData = wolfSSL_X509_notBefore(x509);
```

17.4.2.24 function wolfSSL_X509_notAfter

```
WOLFSSL_API const byte * wolfSSL_X509_notAfter(  
    WOLFSSL_X509 * x509  
)
```

This function the certificate "not after" validity encoded as a byte array.

Parameters:

- **x509** pointer to a WOLFSSL_X509 structure.

See:

- [wolfSSL_X509_get_signature](#)
- [wolfSSL_X509_version](#)
- [wolfSSL_X509_get_der](#)
- [wolfSSL_X509_get_serial_number](#)
- [wolfSSL_X509_notBefore](#)
- [wolfSSL_X509_free](#)

Return:

- NULL returned if the WOLFSSL_X509 structure is NULL.
- byte is returned that contains the notAfterData.

Example

```
WOLFSSL_X509* x509 = (WOLFSSL_X509*)XMALLOC(sizeof(WOLFSSL_X509), NULL,  
    DYNAMIC_TYPE_X509);  
...  
byte* notAfterData = wolfSSL_X509_notAfter(x509);
```

17.4.2.25 function wolfSSL_get_psk_identity_hint

```
WOLFSSL_API const char * wolfSSL_get_psk_identity_hint(  
    const WOLFSSL *  
)
```

This function returns the psk identity hint.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using [wolfSSL_new\(\)](#).

See: [wolfSSL_get_psk_identity](#)

Return:

- pointer a const char pointer to the value that was stored in the arrays member of the WOLFSSL structure is returned.
- NULL returned if the WOLFSSL or Arrays structures are NULL.

Example

```
WOLFSSL* ssl = wolfSSL_new(ctx);  
char* idHint;  
...  
idHint = wolfSSL_get_psk_identity_hint(ssl);  
if(idHint){  
    // The hint was retrieved  
    return idHint;  
} else {
```

```

    // Hint wasn't successfully retrieved
}

```

17.4.2.26 function wolfSSL_get_psk_identity

```

WOLFSSL_API const char * wolfSSL_get_psk_identity(
    const WOLFSSL *
)

```

The function returns a constant pointer to the client_identity member of the Arrays structure.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using [wolfSSL_new\(\)](#).

See:

- [wolfSSL_get_psk_identity_hint](#)
- [wolfSSL_use_psk_identity_hint](#)

Return:

- string the string value of the client_identity member of the Arrays structure.
- NULL if the WOLFSSL structure is NULL or if the Arrays member of the WOLFSSL structure is NULL.

Example

```

WOLFSSL_CTX* ctx = wolfSSL_CTX_new( method );
WOLFSSL* ssl = wolfSSL_new(ctx);
const char* pskID;
...
pskID = wolfSSL_get_psk_identity(ssl);

if(pskID == NULL){
    // There is not a value in pskID
}

```

17.4.2.27 function wolfSSL_CTX_use_psk_identity_hint

```

WOLFSSL_API int wolfSSL_CTX_use_psk_identity_hint(
    WOLFSSL_CTX *,
    const char *
)

```

This function stores the hint argument in the server_hint member of the WOLFSSL_CTX structure.

Parameters:

- **ctx** a pointer to a WOLFSSL_CTX structure, created using [wolfSSL_CTX_new\(\)](#).
- **hint** a constant char pointer that will be copied to the WOLFSSL_CTX structure.

See: [wolfSSL_use_psk_identity_hint](#)

Return: SSL_SUCCESS returned for successful execution of the function.

Example

```

WOLFSSL_CTX* ctx = wolfSSL_CTX_new( protocol method );
const char* hint;
int ret;
...
ret = wolfSSL_CTX_use_psk_identity_hint(ctx, hint);

```

```

if(ret == SSL_SUCCESS){
    // Function was successful.
return ret;
} else {
    // Failure case.
}

```

17.4.2.28 function wolfSSL_use_psk_identity_hint

```

WOLFSSL_API int wolfSSL_use_psk_identity_hint(
    WOLFSSL *,
    const char *
)

```

This function stores the hint argument in the server_hint member of the Arrays structure within the WOLFSSL structure.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using [wolfSSL_new\(\)](#). \para hint a constant character pointer that holds the hint to be saved in memory.

See: [wolfSSL_CTX_use_psk_identity_hint](#)

Return:

- SSL_SUCCESS returned if the hint was successfully stored in the WOLFSSL structure.
- SSL_FAILURE returned if the WOLFSSL or Arrays structures are NULL.

Example

```

WOLFSSL* ssl = wolfSSL_new(ctx);
const char* hint;
...
if(wolfSSL_use_psk_identity_hint(ssl, hint) != SSL_SUCCESS){
    // Handle failure case.
}

```

17.4.2.29 function wolfSSL_get_peer_certificate

```

WOLFSSL_API WOLFSSL_X509 * wolfSSL_get_peer_certificate(
    WOLFSSL * ssl
)

```

This function gets the peer's certificate.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using [wolfSSL_new\(\)](#).

See:

- [wolfSSL_X509_get_issuer_name](#)
- [wolfSSL_X509_get_subject_name](#)
- [wolfSSL_X509_get_isCA](#)

Return:

- pointer a pointer to the peerCert member of the WOLFSSL_X509 structure if it exists.
- 0 returned if the peer certificate issuer size is not defined.

Example

```

WOLFSSL_CTX* ctx = wolfSSL_CTX_new( method );
WOLFSSL* ssl = wolfSSL_new(ctx);
...
WOLFSSL_X509* peerCert = wolfSSL_get_peer_certificate(ssl);

if(peerCert){
    // You have a pointer peerCert to the peer certification
}

```

17.4.2.30 function wolfSSL_get_chain_X509

```

WOLFSSL_API WOLFSSL_X509 * wolfSSL_get_chain_X509(
    WOLFSSL_X509_CHAIN * ,
    int idx
)

```

This function gets the peer's wolfSSL_X509_certificate at index (idx) from the chain of certificates.

Parameters:

- **chain** a pointer to the WOLFSSL_X509_CHAIN used for no dynamic memory SESSION_CACHE.
- **idx** the index of the WOLFSSL_X509 certificate.

See:

- InitDecodedCert
- ParseCertRelative
- CopyDecodedToX509

Return: pointer returns a pointer to a WOLFSSL_X509 structure.

Example

```

WOLFSSL_X509_CHAIN* chain = &session->chain;
int idx = 999; // set idx
...
WOLFSSL_X509_CHAIN ptr;
prt = wolfSSL_get_chain_X509(chain, idx);

if(ptr != NULL){
    //ptr contains the cert at the index specified
} else {
    // ptr is NULL
}

```

17.4.2.31 function wolfSSL_X509_get_subjectCN

```

WOLFSSL_API char * wolfSSL_X509_get_subjectCN(
    WOLFSSL_X509 *
)

```

Returns the common name of the subject from the certificate.

Parameters:

- **x509** a pointer to a WOLFSSL_X509 structure containing certificate information.

See:

- wolfSSL_X509_Name_get_entry
- wolfSSL_X509_get_next_altname

- `wolfSSL_X509_get_issuer_name`
- `wolfSSL_X509_get_subject_name`

Return:

- NULL returned if the x509 structure is null
- string a string representation of the subject's common name is returned upon success

Example

```
WOLFSSL_X509 x509 = (WOLFSSL_X509*)XMALLOC(sizeof(WOLFSSL_X509), NULL,
                                           DYNAMIC_TYPE_X509);

...
int x509Cn = wolfSSL_X509_get_subjectCN(x509);
if(x509Cn == NULL){
    // Deal with NULL case
} else {
    // x509Cn contains the common name
}
```

17.4.2.32 function `wolfSSL_X509_get_der`

```
WOLFSSL_API const unsigned char * wolfSSL_X509_get_der(
    WOLFSSL_X509 * ,
    int *
)
```

This function gets the DER encoded certificate in the WOLFSSL_X509 struct.

Parameters:

- **x509** a pointer to a WOLFSSL_X509 structure containing certificate information.
- **outSz** length of the derBuffer member of the WOLFSSL_X509 struct.

See:

- `wolfSSL_X509_version`
- `wolfSSL_X509_Name_get_entry`
- `wolfSSL_X509_get_next_altname`
- `wolfSSL_X509_get_issuer_name`
- `wolfSSL_X509_get_subject_name`

Return:

- buffer This function returns the DerBuffer structure's buffer member, which is of type byte.
- NULL returned if the x509 or outSz parameter is NULL.

Example

```
WOLFSSL_X509 x509 = (WOLFSSL_X509*)XMALLOC(sizeof(WOLFSSL_X509), NULL,
                                           DYNAMIC_TYPE_X509);

int* outSz; // initialize
...
byte* x509Der = wolfSSL_X509_get_der(x509, outSz);
if(x509Der == NULL){
    // Failure case one of the parameters was NULL
}
```

17.4.2.33 function `wolfSSL_X509_get_notAfter`

```
WOLFSSL_API WOLFSSL_ASN1_TIME * wolfSSL_X509_get_notAfter(
    WOLFSSL_X509 *
)
```

This function checks to see if x509 is NULL and if it's not, it returns the notAfter member of the x509 struct.

Parameters:

- **x509** a pointer to the WOLFSSL_X509 struct.

See: [wolfSSL_X509_get_notBefore](#)

Return:

- pointer to struct with ASN1_TIME to the notAfter member of the x509 struct.
- NULL returned if the x509 object is NULL.

Example

```
WOLFSSL_X509* x509 = (WOLFSSL_X509)XMALOC(sizeof(WOLFSSL_X509), NULL,
DYNAMIC_TYPE_X509) ;
...
const WOLFSSL_ASN1_TIME* notAfter = wolfSSL_X509_get_notAfter(x509);
if(notAfter == NULL){
    // Failure case, the x509 object is null.
}
```

17.4.2.34 function wolfSSL_X509_version

```
WOLFSSL_API int wolfSSL_X509_version(
    WOLFSSL_X509 *
)
```

This function retrieves the version of the X509 certificate.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using [wolfSSL_new\(\)](#).

See:

- [wolfSSL_X509_get_subject_name](#)
- [wolfSSL_X509_get_issuer_name](#)
- [wolfSSL_X509_get_isCA](#)
- [wolfSSL_get_peer_certificate](#)

Return:

- 0 returned if the x509 structure is NULL.
- version the version stored in the x509 structure will be returned.

Example

```
WOLFSSL_X509* x509;
int version;
...
version = wolfSSL_X509_version(x509);
if(!version){
    // The function returned 0, failure case.
}
```

17.4.2.35 function `wolfSSL_X509_d2i_fp`

```
WOLFSSL_API WOLFSSL_X509 * wolfSSL_X509_d2i_fp(
    WOLFSSL_X509 ** x509,
    FILE * file
)
```

If `NO_STDIO_FILESYSTEM` is defined this function will allocate heap memory, initialize a `WOLFSSL_X509` structure and return a pointer to it.

Parameters:

- **x509** a pointer to a `WOLFSSL_X509` pointer.
- **file** a defined type that is a pointer to a `FILE`.

See:

- `wolfSSL_X509_d2i`
- `XFTell`
- `XREWIND`
- `XFSEEK`

Return:

- `*WOLFSSL_X509` `WOLFSSL_X509` structure pointer is returned if the function executes successfully.
- `NULL` if the call to `XFTell` macro returns a negative value.

Example

```
WOLFSSL_X509* x509a = (WOLFSSL_X509*)XMALLOC(sizeof(WOLFSSL_X509), NULL,
DYNAMIC_TYPE_X509);
WOLFSSL_X509** x509 = x509a;
XFILE file; (mapped to struct fs_file*)
...
WOLFSSL_X509* newX509 = wolfSSL_X509_d2i_fp(x509, file);
if(newX509 == NULL){
    // The function returned NULL
}
```

17.4.2.36 function `wolfSSL_X509_load_certificate_file`

```
WOLFSSL_API WOLFSSL_X509 * wolfSSL_X509_load_certificate_file(
    const char * fname,
    int format
)
```

The function loads the x509 certificate into memory.

Parameters:

- **fname** the certificate file to be loaded.
- **format** the format of the certificate.

See:

- `InitDecodedCert`
- `PemToDer`
- `wolfSSL_get_certificate`
- `AssertNotNull`

Return:

- pointer a successful execution returns pointer to a WOLFSSL_X509 structure.
- NULL returned if the certificate was not able to be written.

Example

```
#define cliCert    "certs/client-cert.pem"
...
X509* x509;
...
x509 = wolfSSL_X509_load_certificate_file(cliCert, SSL_FILETYPE_PEM);
AssertNotNull(x509);
```

17.4.2.37 function wolfSSL_X509_get_device_type

```
WOLFSSL_API unsigned char * wolfSSL_X509_get_device_type(
    WOLFSSL_X509 *,
    unsigned char *,
    int *
)
```

This function copies the device type from the x509 structure to the buffer.

Parameters:

- **x509** pointer to a WOLFSSL_X509 structure, created with WOLFSSL_X509_new().
- **in** a pointer to a byte type that will hold the device type (the buffer).
- **inOutSz** the minimum of either the parameter inOutSz or the deviceTypeSz member of the x509 structure.

See:

- [wolfSSL_X509_get_hw_type](#)
- [wolfSSL_X509_get_hw_serial_number](#)
- [wolfSSL_X509_d2i](#)

Return:

- pointer returns a byte pointer holding the device type from the x509 structure.
- NULL returned if the buffer size is NULL.

Example

```
WOLFSSL_X509* x509 = (WOLFSSL_X509)XMALOC(sizeof(WOLFSSL_X509), NULL,
DYNAMIC_TYPE_X509);
byte* in;
int* inOutSz;
...
byte* deviceType = wolfSSL_X509_get_device_type(x509, in, inOutSz);

if(!deviceType){
    // Failure case, NULL was returned.
}
```

17.4.2.38 function wolfSSL_X509_get_hw_type

```
WOLFSSL_API unsigned char * wolfSSL_X509_get_hw_type(
    WOLFSSL_X509 *,
    unsigned char *,
    int *
)
```

The function copies the hwType member of the WOLFSSL_X509 structure to the buffer.

Parameters:

- **x509** a pointer to a WOLFSSL_X509 structure containing certificate information.
- **in** pointer to type byte that represents the buffer.
- **inOutSz** pointer to type int that represents the size of the buffer.

See:

- [wolfSSL_X509_get_hw_serial_number](#)
- [wolfSSL_X509_get_device_type](#)

Return:

- byte The function returns a byte type of the data previously held in the hwType member of the WOLFSSL_X509 structure.
- NULL returned if inOutSz is NULL.

Example

```
WOLFSSL_X509* x509; // X509 certificate
byte* in; // initialize the buffer
int* inOutSz; // holds the size of the buffer
...
byte* hwType = wolfSSL_X509_get_hw_type(x509, in, inOutSz);

if(hwType == NULL){
    // Failure case function returned NULL.
}
```

17.4.2.39 function wolfSSL_X509_get_hw_serial_number

```
WOLFSSL_API unsigned char * wolfSSL_X509_get_hw_serial_number(
    WOLFSSL_X509 *,
    unsigned char *,
    int *
)
```

This function returns the hwSerialNum member of the x509 object.

Parameters:

- **x509** pointer to a WOLFSSL_X509 structure containing certificate information.
- **in** a pointer to the buffer that will be copied to.
- **inOutSz** a pointer to the size of the buffer.

See:

- [wolfSSL_X509_get_subject_name](#)
- [wolfSSL_X509_get_issuer_name](#)
- [wolfSSL_X509_get_isCA](#)
- [wolfSSL_get_peer_certificate](#)
- [wolfSSL_X509_version](#)

Return: pointer the function returns a byte pointer to the in buffer that will contain the serial number loaded from the x509 object.

Example

```
char* serial;
byte* in;
```

```

int* inOutSz;
WOLFSSL_X509 x509;
...
serial = wolfSSL_X509_get_hw_serial_number(x509, in, inOutSz);

if(serial == NULL || serial <= 0){
    // Failure case
}

```

17.4.2.40 function `wolfSSL_SetTmpDH`

```

WOLFSSL_API int wolfSSL_SetTmpDH(
    WOLFSSL * ,
    const unsigned char * p,
    int pSz,
    const unsigned char * g,
    int gSz
)

```

Server Diffie-Hellman Ephemeral parameters setting. This function sets up the group parameters to be used if the server negotiates a cipher suite that uses DHE.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using `wolfSSL_new()`.
- **p** Diffie-Hellman prime number parameter.
- **pSz** size of p.
- **g** Diffie-Hellman “generator” parameter.
- **gSz** size of g.

See: `SSL_accept`

Return:

- `SSL_SUCCESS` upon success.
- `MEMORY_ERROR` will be returned if a memory error was encountered.
- `SIDE_ERROR` will be returned if this function is called on an SSL client instead of an SSL server.

Example

```

WOLFSSL* ssl;
static unsigned char p[] = {...};
static unsigned char g[] = {...};
...
wolfSSL_SetTmpDH(ssl, p, sizeof(p), g, sizeof(g));

```

17.4.2.41 function `wolfSSL_SetTmpDH_buffer`

```

WOLFSSL_API int wolfSSL_SetTmpDH_buffer(
    WOLFSSL * ,
    const unsigned char * b,
    long sz,
    int format
)

```

The function calls the `wolfSSL_SetTMpDH_buffer_wrapper`, which is a wrapper for Diffie-Hellman parameters.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using `wolfSSL_new()`.
- **buf** allocated buffer passed in from `wolfSSL_SetTmpDH_file_wrapper`.
- **sz** a long int that holds the size of the file (fname within `wolfSSL_SetTmpDH_file_wrapper`).
- **format** an integer type passed through from `wolfSSL_SetTmpDH_file_wrapper()` that is a representation of the certificate format.

See:

- `wolfSSL_SetTmpDH_buffer_wrapper`
- `wc_DhParamsLoad`
- `wolfSSL_SetTmpDH`
- `PemToDer`
- `wolfSSL_CTX_SetTmpDH`
- `wolfSSL_CTX_SetTmpDH_file`

Return:

- `SSL_SUCCESS` on successful execution.
- `SSL_BAD_FILETYPE` if the file type is not PEM and is not ASN.1. It will also be returned if the `wc_DhParamsLoad` does not return normally.
- `SSL_NO_PEM_HEADER` returns from `PemToDer` if there is not a PEM header.
- `SSL_BAD_FILE` returned if there is a file error in `PemToDer`.
- `SSL_FATAL_ERROR` returned from `PemToDer` if there was a copy error.
- `MEMORY_E` - if there was a memory allocation error.
- `BAD_FUNC_ARG` returned if the WOLFSSL struct is NULL or if there was otherwise a NULL argument passed to a subroutine.
- `DH_KEY_SIZE_E` is returned if there is a key size error in `wolfSSL_SetTmpDH()`.
- `SIDE_ERROR` returned if it is not the server side in `wolfSSL_SetTmpDH`.

Example

```
Static int wolfSSL_SetTmpDH_file_wrapper(WOLFSSL_CTX* ctx, WOLFSSL* ssl,
Const char* fname, int format);
long sz = 0;
byte* myBuffer = staticBuffer[FILE_BUFFER_SIZE];
...
if(ssl)
ret = wolfSSL_SetTmpDH_buffer(ssl, myBuffer, sz, format);
```

17.4.2.42 function `wolfSSL_SetTmpDH_file`

```
WOLFSSL_API int wolfSSL_SetTmpDH_file(
    WOLFSSL * ,
    const char * f,
    int format
)
```

This function calls `wolfSSL_SetTmpDH_file_wrapper` to set server Diffie-Hellman parameters.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using `wolfSSL_new()`.
- **fname** a constant char pointer holding the certificate.
- **format** an integer type that holds the format of the certification.

See:

- `wolfSSL_CTX_SetTmpDH_file`
- `wolfSSL_SetTmpDH_file_wrapper`
- `wolfSSL_SetTmpDH_buffer`

- [wolfSSL_CTX_SetTmpDH_buffer](#)
- [wolfSSL_SetTmpDH_buffer_wrapper](#)
- [wolfSSL_SetTmpDH](#)
- [wolfSSL_CTX_SetTmpDH](#)

Return:

- SSL_SUCCESS returned on successful completion of this function and its subroutines.
- MEMORY_E returned if a memory allocation failed in this function or a subroutine.
- SIDE_ERROR if the side member of the Options structure found in the WOLFSSL struct is not the server side.
- SSL_BAD_FILETYPE returns if the certificate fails a set of checks.
- DH_KEY_SIZE_E returned if the DH parameter's key size is less than the value of the minDhKeySz member in the WOLFSSL struct.
- DH_KEY_SIZE_E returned if the DH parameter's key size is greater than the value of the maxDhKeySz member in the WOLFSSL struct.
- BAD_FUNC_ARG returns if an argument value is NULL that is not permitted such as, the WOLFSSL structure.

Example

```
WOLFSSL* ssl = wolfSSL_new(ctx);
const char* dhParam;
...
AssertIntNE(SSL_SUCCESS,
wolfSSL_SetTmpDH_file(ssl, dhParam, SSL_FILETYPE_PEM));
```

17.4.2.43 function [wolfSSL_CTX_SetTmpDH](#)

```
WOLFSSL_API int wolfSSL_CTX_SetTmpDH(
    WOLFSSL_CTX *,
    const unsigned char * p,
    int pSz,
    const unsigned char * g,
    int gSz
)
```

Sets the parameters for the server CTX Diffie-Hellman.

Parameters:

- **ctx** a pointer to a WOLFSSL_CTX structure, created using [wolfSSL_CTX_new\(\)](#).
- **p** a constant unsigned char pointer loaded into the buffer member of the serverDH_P struct.
- **pSz** an int type representing the size of p, initialized to MAX_DH_SIZE.
- **g** a constant unsigned char pointer loaded into the buffer member of the serverDH_G struct.
- **gSz** an int type representing the size of g, initialized ot MAX_DH_SIZE.

See:

- [wolfSSL_SetTmpDH](#)
- [wc_DhParamsLoad](#)

Return:

- SSL_SUCCESS returned if the function and all subroutines return without error.
- BAD_FUNC_ARG returned if the CTX, p or g parameters are NULL.
- DH_KEY_SIZE_E returned if the DH parameter's key size is less than the value of the minDhKeySz member of the WOLFSSL_CTX struct.
- DH_KEY_SIZE_E returned if the DH parameter's key size is greater than the value of the maxDhKeySz member of the WOLFSSL_CTX struct.

- MEMORY_E returned if the allocation of memory failed in this function or a subroutine.

Example

```
WOLFSSL_CTX* ctx = WOLFSSL_CTX_new( protocol );
byte* p;
byte* g;
word32 pSz = (word32)sizeof(p)/sizeof(byte);
word32 gSz = (word32)sizeof(g)/sizeof(byte);
...
int ret = wolfSSL_CTX_SetTmpDH(ctx, p, pSz, g, gSz);

if(ret != SSL_SUCCESS){
    // Failure case
}
```

17.4.2.44 function wolfSSL_CTX_SetTmpDH_buffer

```
WOLFSSL_API int wolfSSL_CTX_SetTmpDH_buffer(
    WOLFSSL_CTX *,
    const unsigned char * b,
    long sz,
    int format
)
```

A wrapper function that calls wolfSSL_SetTmpDH_buffer_wrapper.

Parameters:

- **ctx** a pointer to a WOLFSSL structure, created using `wolfSSL_CTX_new()`.
- **buf** a pointer to a constant unsigned char type that is allocated as the buffer and passed through to wolfSSL_SetTmpDH_buffer_wrapper.
- **sz** a long integer type that is derived from the fname parameter in wolfSSL_SetTmpDH_file_wrapper().
- **format** an integer type passed through from wolfSSL_SetTmpDH_file_wrapper().

See:

- wolfSSL_SetTmpDH_buffer_wrapper
- wolfSSL_SetTmpDH_buffer
- wolfSSL_SetTmpDH_file_wrapper
- `wolfSSL_CTX_SetTmpDH_file`

Return:

- 0 returned for a successful execution.
- BAD_FUNC_ARG returned if the ctx or buf parameters are NULL.
- MEMORY_E if there is a memory allocation error.
- SSL_BAD_FILETYPE returned if format is not correct.

Example

```
static int wolfSSL_SetTmpDH_file_wrapper(WOLFSSL_CTX* ctx, WOLFSSL* ssl,
Const char* fname, int format);
#ifdef WOLFSSL_SMALL_STACK
byte staticBuffer[1]; // force heap usage
#else
byte* staticBuffer;
long sz = 0;
...
if(ssl){
```

```

    ret = wolfSSL_SetTmpDH_buffer(ssl, myBuffer, sz, format);
} else {
ret = wolfSSL_CTX_SetTmpDH_buffer(ctx, myBuffer, sz, format);
}

```

17.4.2.45 function wolfSSL_CTX_SetTmpDH_file

```

WOLFSSL_API int wolfSSL_CTX_SetTmpDH_file(
    WOLFSSL_CTX *,
    const char * f,
    int format
)

```

The function calls wolfSSL_SetTmpDH_file_wrapper to set the server Diffie-Hellman parameters.

Parameters:

- **ctx** a pointer to a WOLFSSL_CTX structure, created using [wolfSSL_CTX_new\(\)](#).
- **fname** a constant character pointer to a certificate file.
- **format** an integer type passed through from wolfSSL_SetTmpDH_file_wrapper() that is a representation of the certificate format.

See:

- wolfSSL_SetTmpDH_buffer_wrapper
- [wolfSSL_SetTmpDH](#)
- [wolfSSL_CTX_SetTmpDH](#)
- [wolfSSL_SetTmpDH_buffer](#)
- [wolfSSL_CTX_SetTmpDH_buffer](#)
- wolfSSL_SetTmpDH_file_wrapper
- AllocDer
- PemToDer

Return:

- SSL_SUCCESS returned if the wolfSSL_SetTmpDH_file_wrapper or any of its subroutines return successfully.
- MEMORY_E returned if an allocation of dynamic memory fails in a subroutine.
- BAD_FUNC_ARG returned if the ctx or fname parameters are NULL or if a subroutine is passed a NULL argument.
- SSL_BAD_FILE returned if the certificate file is unable to open or if the a set of checks on the file fail from wolfSSL_SetTmpDH_file_wrapper.
- SSL_BAD_FILETYPE returned if the format is not PEM or ASN.1 from wolfSSL_SetTmpDH_buffer_wrapper().
- DH_KEY_SIZE_E returned if the DH parameter's key size is less than the value of the minDhKeySz member of the WOLFSSL_CTX struct.
- DH_KEY_SIZE_E returned if the DH parameter's key size is greater than the value of the maxDhKeySz member of the WOLFSSL_CTX struct.
- SIDE_ERROR returned in [wolfSSL_SetTmpDH\(\)](#) if the side is not the server end.
- SSL_NO_PEM_HEADER returned from PemToDer if there is no PEM header.
- SSL_FATAL_ERROR returned from PemToDer if there is a memory copy failure.

Example

```

#define dhParam      "certs/dh2048.pem"
#define ASSERTiNTne(x, y)    AssertInt(x, y, !=, ==)
WOLFSSL_CTX* ctx;
...
AssertNotNull(ctx = wolfSSL_CTX_new(wolfSSLv23_client_method()))
...

```

```
AssertIntNE(SSL_SUCCESS, wolfSSL_CTX_SetTmpDH_file(NULL, dhParam,
SSL_FILETYPE_PEM));
```

17.4.2.46 function `wolfSSL_CTX_SetMinDhKey_Sz`

```
WOLFSSL_API int wolfSSL_CTX_SetMinDhKey_Sz(
    WOLFSSL_CTX * ctx,
    word16
)
```

This function sets the minimum size (in bits) of the Diffie Hellman key size by accessing the `minDhKeySz` member in the `WOLFSSL_CTX` structure.

Parameters:

- **ssl** a pointer to a `WOLFSSL` structure, created using `wolfSSL_new()`.
- **keySz_bits** a `word16` type used to set the minimum DH key size in bits. The `WOLFSSL_CTX` struct holds this information in the `minDhKeySz` member.

See:

- `wolfSSL_SetMinDhKey_Sz`
- `wolfSSL_CTX_SetMaxDhKey_Sz`
- `wolfSSL_SetMaxDhKey_Sz`
- `wolfSSL_GetDhKey_Sz`
- `wolfSSL_CTX_SetTMpDH_file`

Return:

- `SSL_SUCCESS` returned if the function completes successfully.
- `BAD_FUNC_ARG` returned if the `WOLFSSL_CTX` struct is `NULL` or if the `keySz_bits` is greater than 16,000 or not divisible by 8.

Example

```
public static int CTX_SetMinDhKey_Sz(IntPtr ctx, short minDhKey){
...
return wolfSSL_CTX_SetMinDhKey_Sz(local_ctx, minDhKeyBits);
```

17.4.2.47 function `wolfSSL_SetMinDhKey_Sz`

```
WOLFSSL_API int wolfSSL_SetMinDhKey_Sz(
    WOLFSSL * ,
    word16
)
```

Sets the minimum size (in bits) for a Diffie-Hellman key in the `WOLFSSL` structure.

Parameters:

- **ssl** a pointer to a `WOLFSSL` structure, created using `wolfSSL_new()`.
- **keySz_bits** a `word16` type used to set the minimum DH key size in bits. The `WOLFSSL_CTX` struct holds this information in the `minDhKeySz` member.

See:

- `wolfSSL_CTX_SetMinDhKey_Sz`
- `wolfSSL_GetDhKey_Sz`

Return:

- `SSL_SUCCESS` the minimum size was successfully set.

- BAD_FUNC_ARG the WOLFSSL structure was NULL or if the keySz_bits is greater than 16,000 or not divisible by 8.

Example

```
WOLFSSL* ssl = wolfSSL_new(ctx);
word16 keySz_bits;
...
if(wolfSSL_SetMinDhKey_Sz(ssl, keySz_bits) != SSL_SUCCESS){
    // Failed to set.
}
```

17.4.2.48 function wolfSSL_CTX_SetMaxDhKey_Sz

```
WOLFSSL_API int wolfSSL_CTX_SetMaxDhKey_Sz(
    WOLFSSL_CTX *,
    word16
)
```

This function sets the maximum size (in bits) of the Diffie Hellman key size by accessing the maxDhKeySz member in the WOLFSSL_CTX structure.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using [wolfSSL_new\(\)](#).
- **keySz_bits** a word16 type used to set the maximum DH key size in bits. The WOLFSSL_CTX struct holds this information in the maxDhKeySz member.

See:

- [wolfSSL_SetMinDhKey_Sz](#)
- [wolfSSL_CTX_SetMinDhKey_Sz](#)
- [wolfSSL_SetMaxDhKey_Sz](#)
- [wolfSSL_GetDhKey_Sz](#)
- [wolfSSL_CTX_SetTMpDH_file](#)

Return:

- SSL_SUCCESS returned if the function completes successfully.
- BAD_FUNC_ARG returned if the WOLFSSL_CTX struct is NULL or if the keySz_bits is greater than 16,000 or not divisible by 8.

Example

```
public static int CTX_SetMaxDhKey_Sz(IntPtr ctx, short maxDhKey){
...
return wolfSSL_CTX_SetMaxDhKey_Sz(local_ctx, keySz_bits);
}
```

17.4.2.49 function wolfSSL_SetMaxDhKey_Sz

```
WOLFSSL_API int wolfSSL_SetMaxDhKey_Sz(
    WOLFSSL *,
    word16
)
```

Sets the maximum size (in bits) for a Diffie-Hellman key in the WOLFSSL structure.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using [wolfSSL_new\(\)](#).
- **keySz** a word16 type representing the bit size of the maximum DH key.

See:

- [wolfSSL_CTX_SetMaxDhKey_Sz](#)
- [wolfSSL_GetDhKey_Sz](#)

Return:

- SSL_SUCCESS the maximum size was successfully set.
- BAD_FUNC_ARG the WOLFSSL structure was NULL or the keySz parameter was greater than the allowable size or not divisible by 8.

Example

```
WOLFSSL* ssl = wolfSSL_new(ctx);
word16 keySz;
...
if(wolfSSL_SetMaxDhKey(ssl, keySz) != SSL_SUCCESS){
    // Failed to set.
}
```

17.4.2.50 function wolfSSL_GetDhKey_Sz

```
WOLFSSL_API int wolfSSL_GetDhKey_Sz(
    WOLFSSL *
```

Returns the value of dhKeySz (in bits) that is a member of the options structure. This value represents the Diffie-Hellman key size in bytes.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using [wolfSSL_new\(\)](#).

See:

- [wolfSSL_SetMinDhKey_sz](#)
- [wolfSSL_CTX_SetMinDhKey_Sz](#)
- [wolfSSL_CTX_SetTmpDH](#)
- [wolfSSL_SetTmpDH](#)
- [wolfSSL_CTX_SetTmpDH_file](#)

Return:

- dhKeySz returns the value held in ssl->options.dhKeySz which is an integer value representing a size in bits.
- BAD_FUNC_ARG returns if the WOLFSSL struct is NULL.

Example

```
WOLFSSL_CTX* ctx = wolfSSL_CTX_new( protocol method );
WOLFSSL* ssl = wolfSSL_new(ctx);
int dhKeySz;
...
dhKeySz = wolfSSL_GetDhKey_Sz(ssl);

if(dhKeySz == BAD_FUNC_ARG || dhKeySz <= 0){
    // Failure case
} else {
    // dhKeySz holds the size of the key.
}
```

17.4.2.51 function wolfSSL_CTX_SetMinRsaKey_Sz

```
WOLFSSL_API int wolfSSL_CTX_SetMinRsaKey_Sz(  
    WOLFSSL_CTX * ,  
    short  
)
```

Sets the minimum RSA key size in both the WOLFSSL_CTX structure and the WOLFSSL_CERT_MANAGER structure.

Parameters:

- **ctx** a pointer to a WOLFSSL_CTX structure, created using [wolfSSL_CTX_new\(\)](#).
- **keySz** a short integer type stored in minRsaKeySz in the ctx structure and the cm structure converted to bytes.

See: [wolfSSL_SetMinRsaKey_Sz](#)

Return:

- SSL_SUCCESS returned on successful execution of the function.
- BAD_FUNC_ARG returned if the ctx structure is NULL or the keySz is less than zero or not divisible by 8.

Example

```
WOLFSSL_CTX* ctx = SSL_CTX_new(method);  
(void)minDhKeyBits;  
ourCert = myoptarg;  
...  
minDhKeyBits = atoi(myoptarg);  
...  
if(wolfSSL_CTX_SetMinRsaKey_Sz(ctx, minRsaKeyBits) != SSL_SUCCESS){  
...  
}
```

17.4.2.52 function wolfSSL_SetMinRsaKey_Sz

```
WOLFSSL_API int wolfSSL_SetMinRsaKey_Sz(  
    WOLFSSL * ,  
    short  
)
```

Sets the minimum allowable key size in bits for RSA located in the WOLFSSL structure.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using [wolfSSL_new\(\)](#).
- **keySz** a short integer value representing the the minimum key in bits.

See: [wolfSSL_CTX_SetMinRsaKey_Sz](#)

Return:

- SSL_SUCCESS the minimum was set successfully.
- BAD_FUNC_ARG returned if the ssl structure is NULL or if the keySz is less than zero or not divisible by 8.

Example

```
WOLFSSL* ssl = wolfSSL_new(ctx);  
short keySz;  
...  
}
```

```
int isSet = wolfSSL_SetMinRsaKey_Sz(ssl, keySz);
if(isSet != SSL_SUCCESS){
    Failed to set.
}
```

17.4.2.53 function wolfSSL_CTX_SetMinEccKey_Sz

```
WOLFSSL_API int wolfSSL_CTX_SetMinEccKey_Sz(
    WOLFSSL_CTX *,
    short
)
```

Sets the minimum size in bits for the ECC key in the WOLF_CTX structure and the WOLFSSL_CERT_MANAGER structure.

Parameters:

- **ctx** a pointer to a WOLFSSL_CTX structure, created using [wolfSSL_CTX_new\(\)](#).
- **keySz** a short integer type that represents the minimum ECC key size in bits.

See: [wolfSSL_SetMinEccKey_Sz](#)

Return:

- SSL_SUCCESS returned for a successful execution and the minEccKeySz member is set.
- BAD_FUNC_ARG returned if the WOLFSSL_CTX struct is NULL or if the keySz is negative or not divisible by 8.

Example

```
WOLFSSL_CTX* ctx = wolfSSL_CTX_new( protocol method );
short keySz; // minimum key size
...
if(wolfSSL_CTX_SetMinEccKey(ctx, keySz) != SSL_SUCCESS){
    // Failed to set min key size
}
```

17.4.2.54 function wolfSSL_SetMinEccKey_Sz

```
WOLFSSL_API int wolfSSL_SetMinEccKey_Sz(
    WOLFSSL *,
    short
)
```

Sets the value of the minEccKeySz member of the options structure. The options struct is a member of the WOLFSSL structure and is accessed through the ssl parameter.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using [wolfSSL_new\(\)](#).
- **keySz** value used to set the minimum ECC key size. Sets value in the options structure.

See:

- [wolfSSL_CTX_SetMinEccKey_Sz](#)
- [wolfSSL_CTX_SetMinRsaKey_Sz](#)
- [wolfSSL_SetMinRsaKey_Sz](#)

Return:

- SSL_SUCCESS if the function successfully set the minEccKeySz member of the options structure.

- BAD_FUNC_ARG if the WOLFSSL_CTX structure is NULL or if the key size (keySz) is less than 0 (zero) or not divisible by 8.

Example

```
WOLFSSL* ssl = wolfSSL_new(ctx); // New session
short keySz = 999; // should be set to min key size allowable
...
if(wolfSSL_SetMinEccKey_Sz(ssl, keySz) != SSL_SUCCESS){
    // Failure case.
}
```

17.4.2.55 function wolfSSL_make_eap_keys

```
WOLFSSL_API int wolfSSL_make_eap_keys(
    WOLFSSL * ,
    void * key,
    unsigned int len,
    const char * label
)
```

This function is used by EAP_TLS and EAP-TTLS to derive keying material from the master secret.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using `wolfSSL_new()`.
- **msk** a void pointer variable that will hold the result of the p_hash function.
- **len** an unsigned integer that represents the length of the msk variable.
- **label** a constant char pointer that is copied from in wc_PRF().

See:

- wc_PRF
- wc_HmacFinal
- wc_HmacUpdate

Return:

- BUFFER_E returned if the actual size of the buffer exceeds the maximum size allowable.
- MEMORY_E returned if there is an error with memory allocation.

Example

```
WOLFSSL* ssl = wolfSSL_new(ctx);;
void* msk;
unsigned int len;
const char* label;
...
return wolfSSL_make_eap_keys(ssl, msk, len, label);
```

17.4.2.56 function wolfSSL_CTX_load_verify_buffer

```
WOLFSSL_API int wolfSSL_CTX_load_verify_buffer(
    WOLFSSL_CTX * ,
    const unsigned char * ,
    long ,
    int
)
```

This function loads a CA certificate buffer into the WOLFSSL Context. It behaves like the non-buffered version, only differing in its ability to be called with a buffer as input instead of a file. The buffer is provided by the `in` argument of size `sz`. `format` specifies the format type of the buffer; `SSL_FILETYPE_ASN1` or `SSL_FILETYPE_PEM`. More than one CA certificate may be loaded per buffer as long as the format is in PEM. Please see the examples for proper usage.

Parameters:

- **ctx** pointer to the SSL context, created with `wolfSSL_CTX_new()`.
- **in** pointer to the CA certificate buffer.
- **sz** size of the input CA certificate buffer, in.
- **format** format of the buffer certificate, either `SSL_FILETYPE_ASN1` or `SSL_FILETYPE_PEM`.

See:

- `wolfSSL_CTX_load_verify_locations`
- `wolfSSL_CTX_use_certificate_buffer`
- `wolfSSL_CTX_use_PrivateKey_buffer`
- `wolfSSL_CTX_use_certificate_chain_buffer`
- `wolfSSL_use_certificate_buffer`
- `wolfSSL_use_PrivateKey_buffer`
- `wolfSSL_use_certificate_chain_buffer`

Return:

- `SSL_SUCCESS` upon success
- `SSL_BAD_FILETYPE` will be returned if the file is the wrong format.
- `SSL_BAD_FILE` will be returned if the file doesn't exist, can't be read, or is corrupted.
- `MEMORY_E` will be returned if an out of memory condition occurs.
- `ASN_INPUT_E` will be returned if Base16 decoding fails on the file.
- `BUFFER_E` will be returned if a chain buffer is bigger than the receiving buffer.

Example

```
int ret = 0;
int sz = 0;
WOLFSSL_CTX* ctx;
byte certBuff[...];
...

ret = wolfSSL_CTX_load_verify_buffer(ctx, certBuff, sz, SSL_FILETYPE_PEM);
if (ret != SSL_SUCCESS) {
    // error loading CA certs from buffer
}
...
```

17.4.2.57 function wolfSSL_CTX_load_verify_buffer_ex

```
WOLFSSL_API int wolfSSL_CTX_load_verify_buffer_ex(
    WOLFSSL_CTX *,
    const unsigned char *,
    long ,
    int ,
    int ,
    word32
)
```

This function loads a CA certificate buffer into the WOLFSSL Context. It behaves like the non-buffered version, only differing in its ability to be called with a buffer as input instead of a file. The buffer is pro-

vided by the in argument of size sz. format specifies the format type of the buffer; SSL_FILETYPE_ASN1 or SSL_FILETYPE_PEM. More than one CA certificate may be loaded per buffer as long as the format is in PEM. The _ex version was added in PR 2413 and supports additional arguments for userChain and flags.

Parameters:

- **ctx** pointer to the SSL context, created with `wolfSSL_CTX_new()`.
- **in** pointer to the CA certificate buffer.
- **sz** size of the input CA certificate buffer, in.
- **format** format of the buffer certificate, either SSL_FILETYPE_ASN1 or SSL_FILETYPE_PEM.
- **userChain** If using format WOLFSSL_FILETYPE_ASN1 this set to non-zero indicates a chain of DER's is being presented.
- **flags** See `ssl.h` around WOLFSSL_LOAD_VERIFY_DEFAULT_FLAGS.

See:

- `wolfSSL_CTX_load_verify_buffer`
- `wolfSSL_CTX_load_verify_locations`
- `wolfSSL_CTX_use_certificate_buffer`
- `wolfSSL_CTX_use_PrivateKey_buffer`
- `wolfSSL_CTX_use_certificate_chain_buffer`
- `wolfSSL_use_certificate_buffer`
- `wolfSSL_use_PrivateKey_buffer`
- `wolfSSL_use_certificate_chain_buffer`

Return:

- SSL_SUCCESS upon success
- SSL_BAD_FILETYPE will be returned if the file is the wrong format.
- SSL_BAD_FILE will be returned if the file doesn't exist, can't be read, or is corrupted.
- MEMORY_E will be returned if an out of memory condition occurs.
- ASN_INPUT_E will be returned if Base16 decoding fails on the file.
- BUFFER_E will be returned if a chain buffer is bigger than the receiving buffer.

Example

```
int ret = 0;
int sz = 0;
WOLFSSL_CTX* ctx;
byte certBuff[...];
...

// Example for force loading an expired certificate
ret = wolfSSL_CTX_load_verify_buffer_ex(ctx, certBuff, sz, SSL_FILETYPE_PEM,
    0, (WOLFSSL_LOAD_FLAG_DATE_ERR_OKAY));
if (ret != SSL_SUCCESS) {
    // error loading CA certs from buffer
}
...
```

17.4.2.58 function `wolfSSL_CTX_load_verify_chain_buffer_format`

```
WOLFSSL_API int wolfSSL_CTX_load_verify_chain_buffer_format(
    WOLFSSL_CTX *,
    const unsigned char *,
    long ,
    int
```

)

This function loads a CA certificate chain buffer into the WOLFSSL Context. It behaves like the non-buffered version, only differing in its ability to be called with a buffer as input instead of a file. The buffer is provided by the `in` argument of size `sz`. `format` specifies the format type of the buffer; `SSL_FILETYPE_ASN1` or `SSL_FILETYPE_PEM`. More than one CA certificate may be loaded per buffer as long as the format is in PEM. Please see the examples for proper usage.

Parameters:

- **ctx** pointer to the SSL context, created with `wolfSSL_CTX_new()`.
- **in** pointer to the CA certificate buffer.
- **sz** size of the input CA certificate buffer, in.
- **format** format of the buffer certificate, either `SSL_FILETYPE_ASN1` or `SSL_FILETYPE_PEM`.

See:

- `wolfSSL_CTX_load_verify_locations`
- `wolfSSL_CTX_use_certificate_buffer`
- `wolfSSL_CTX_use_PrivateKey_buffer`
- `wolfSSL_CTX_use_certificate_chain_buffer`
- `wolfSSL_use_certificate_buffer`
- `wolfSSL_use_PrivateKey_buffer`
- `wolfSSL_use_certificate_chain_buffer`

Return:

- `SSL_SUCCESS` upon success
- `SSL_BAD_FILETYPE` will be returned if the file is the wrong format.
- `SSL_BAD_FILE` will be returned if the file doesn't exist, can't be read, or is corrupted.
- `MEMORY_E` will be returned if an out of memory condition occurs.
- `ASN_INPUT_E` will be returned if Base16 decoding fails on the file.
- `BUFFER_E` will be returned if a chain buffer is bigger than the receiving buffer.

Example

```
int ret = 0;
int sz = 0;
WOLFSSL_CTX* ctx;
byte certBuff[...];
...

ret = wolfSSL_CTX_load_verify_chain_buffer_format(ctx,
                                                  certBuff, sz, WOLFSSL_FILETYPE_ASN1);
if (ret != SSL_SUCCESS) {
    // error loading CA certs from buffer
}
...
```

17.4.2.59 function `wolfSSL_CTX_use_certificate_buffer`

```
WOLFSSL_API int wolfSSL_CTX_use_certificate_buffer(
    WOLFSSL_CTX *,
    const unsigned char *,
    long,
    int
)
```

This function loads a certificate buffer into the WOLFSSL Context. It behaves like the non-buffered version, only differing in its ability to be called with a buffer as input instead of a file. The buffer is provided by the in argument of size sz. format specifies the format type of the buffer; SSL_FILETYPE_ASN1 or SSL_FILETYPE_PEM. Please see the examples for proper usage.

Parameters:

- **ctx** pointer to the SSL context, created with `wolfSSL_CTX_new()`.
- **in** the input buffer containing the certificate to be loaded.
- **sz** the size of the input buffer.
- **format** the format of the certificate located in the input buffer (in). Possible values are SSL_FILETYPE_ASN1 or SSL_FILETYPE_PEM.

See:

- `wolfSSL_CTX_load_verify_buffer`
- `wolfSSL_CTX_use_PrivateKey_buffer`
- `wolfSSL_CTX_use_certificate_chain_buffer`
- `wolfSSL_use_certificate_buffer`
- `wolfSSL_use_PrivateKey_buffer`
- `wolfSSL_use_certificate_chain_buffer`

Return:

- SSL_SUCCESS upon success
- SSL_BAD_FILETYPE will be returned if the file is the wrong format.
- SSL_BAD_FILE will be returned if the file doesn't exist, can't be read, or is corrupted.
- MEMORY_E will be returned if an out of memory condition occurs.
- ASN_INPUT_E will be returned if Base16 decoding fails on the file.

Example

```
int ret = 0;
int sz = 0;
WOLFSSL_CTX* ctx;
byte certBuff[...];
...
ret = wolfSSL_CTX_use_certificate_buffer(ctx, certBuff, sz, SSL_FILETYPE_PEM);
if (ret != SSL_SUCCESS) {
    // error loading certificate from buffer
}
...
```

17.4.2.60 function `wolfSSL_CTX_use_PrivateKey_buffer`

```
WOLFSSL_API int wolfSSL_CTX_use_PrivateKey_buffer(
    WOLFSSL_CTX *,
    const unsigned char *,
    long ,
    int
)
```

This function loads a private key buffer into the SSL Context. It behaves like the non-buffered version, only differing in its ability to be called with a buffer as input instead of a file. The buffer is provided by the in argument of size sz. format specifies the format type of the buffer; SSL_FILETYPE_ASN1 or SSL_FILETYPE_PEM. Please see the examples for proper usage.

Parameters:

- **ctx** pointer to the SSL context, created with `wolfSSL_CTX_new()`.

- **in** the input buffer containing the private key to be loaded.
- **sz** the size of the input buffer.
- **format** the format of the private key located in the input buffer (in). Possible values are SSL_FILETYPE_ASN1 or SSL_FILETYPE_PEM.

See:

- [wolfSSL_CTX_load_verify_buffer](#)
- [wolfSSL_CTX_use_certificate_buffer](#)
- [wolfSSL_CTX_use_certificate_chain_buffer](#)
- [wolfSSL_use_certificate_buffer](#)
- [wolfSSL_use_PrivateKey_buffer](#)
- [wolfSSL_use_certificate_chain_buffer](#)

Return:

- SSL_SUCCESS upon success
- SSL_BAD_FILETYPE will be returned if the file is the wrong format.
- SSL_BAD_FILE will be returned if the file doesn't exist, can't be read, or is corrupted.
- MEMORY_E will be returned if an out of memory condition occurs.
- ASN_INPUT_E will be returned if Base16 decoding fails on the file.
- NO_PASSWORD will be returned if the key file is encrypted but no password is provided.

Example

```
int ret = 0;
int sz = 0;
WOLFSSL_CTX* ctx;
byte keyBuff[...];
...
ret = wolfSSL_CTX_use_PrivateKey_buffer(ctx, keyBuff, sz, SSL_FILETYPE_PEM);
if (ret != SSL_SUCCESS) {
    // error loading private key from buffer
}
...
```

17.4.2.61 function `wolfSSL_CTX_use_certificate_chain_buffer`

```
WOLFSSL_API int wolfSSL_CTX_use_certificate_chain_buffer(
    WOLFSSL_CTX *,
    const unsigned char *,
    long
)
```

This function loads a certificate chain buffer into the WOLFSSL Context. It behaves like the non-buffered version, only differing in its ability to be called with a buffer as input instead of a file. The buffer is provided by the in argument of size sz. The buffer must be in PEM format and start with the subject's certificate, ending with the root certificate. Please see the examples for proper usage.

Parameters:

- **ctx** pointer to the SSL context, created with [wolfSSL_CTX_new\(\)](#).
- **in** the input buffer containing the PEM-formatted certificate chain to be loaded.
- **sz** the size of the input buffer.

See:

- [wolfSSL_CTX_load_verify_buffer](#)
- [wolfSSL_CTX_use_certificate_buffer](#)
- [wolfSSL_CTX_use_PrivateKey_buffer](#)

- `wolfSSL_use_certificate_buffer`
- `wolfSSL_use_PrivateKey_buffer`
- `wolfSSL_use_certificate_chain_buffer`

Return:

- `SSL_SUCCESS` upon success
- `SSL_BAD_FILETYPE` will be returned if the file is the wrong format.
- `SSL_BAD_FILE` will be returned if the file doesn't exist, can't be read, or is corrupted.
- `MEMORY_E` will be returned if an out of memory condition occurs.
- `ASN_INPUT_E` will be returned if Base16 decoding fails on the file.
- `BUFFER_E` will be returned if a chain buffer is bigger than the receiving buffer.

Example

```
int ret = 0;
int sz = 0;
WOLFSSL_CTX* ctx;
byte certChainBuff[...];
...
ret = wolfSSL_CTX_use_certificate_chain_buffer(ctx, certChainBuff, sz);
if (ret != SSL_SUCCESS) {
    // error loading certificate chain from buffer
}
...
```

17.4.2.62 function `wolfSSL_use_certificate_buffer`

```
WOLFSSL_API int wolfSSL_use_certificate_buffer(
    WOLFSSL *,
    const unsigned char *,
    long ,
    int
)
```

This function loads a certificate buffer into the WOLFSSL object. It behaves like the non-buffered version, only differing in its ability to be called with a buffer as input instead of a file. The buffer is provided by the `in` argument of size `sz`. `format` specifies the format type of the buffer; `SSL_FILETYPE_ASN1` or `SSL_FILETYPE_PEM`. Please see the examples for proper usage.

Parameters:

- **ssl** pointer to the SSL session, created with `wolfSSL_new()`.
- **in** buffer containing certificate to load.
- **sz** size of the certificate located in buffer.
- **format** format of the certificate to be loaded. Possible values are `SSL_FILETYPE_ASN1` or `SSL_FILETYPE_PEM`.

See:

- `wolfSSL_CTX_load_verify_buffer`
- `wolfSSL_CTX_use_certificate_buffer`
- `wolfSSL_CTX_use_PrivateKey_buffer`
- `wolfSSL_CTX_use_certificate_chain_buffer`
- `wolfSSL_use_PrivateKey_buffer`
- `wolfSSL_use_certificate_chain_buffer`

Return:

- `SSL_SUCCESS` upon success.

- `SSL_BAD_FILETYPE` will be returned if the file is the wrong format.
- `SSL_BAD_FILE` will be returned if the file doesn't exist, can't be read, or is corrupted.
- `MEMORY_E` will be returned if an out of memory condition occurs.
- `ASN_INPUT_E` will be returned if Base16 decoding fails on the file.

Example

```
int buffSz;
int ret;
byte certBuff[...];
WOLFSSL* ssl = 0;
...

ret = wolfSSL_use_certificate_buffer(ssl, certBuff, buffSz, SSL_FILETYPE_PEM);
if (ret != SSL_SUCCESS) {
    // failed to load certificate from buffer
}
```

17.4.2.63 function `wolfSSL_use_PrivateKey_buffer`

```
WOLFSSL_API int wolfSSL_use_PrivateKey_buffer(
    WOLFSSL *,
    const unsigned char *,
    long ,
    int
)
```

This function loads a private key buffer into the WOLFSSL object. It behaves like the non-buffered version, only differing in its ability to be called with a buffer as input instead of a file. The buffer is provided by the `in` argument of size `sz`. `format` specifies the format type of the buffer; `SSL_FILETYPE_ASN1` or `SSL_FILETYPE_PEM`. Please see the examples for proper usage.

Parameters:

- **ssl** pointer to the SSL session, created with `wolfSSL_new()`.
- **in** buffer containing private key to load.
- **sz** size of the private key located in buffer.
- **format** format of the private key to be loaded. Possible values are `SSL_FILETYPE_ASN1` or `SSL_FILETYPE_PEM`.

See:

- `wolfSSL_use_PrivateKey`
- `wolfSSL_CTX_load_verify_buffer`
- `wolfSSL_CTX_use_certificate_buffer`
- `wolfSSL_CTX_use_PrivateKey_buffer`
- `wolfSSL_CTX_use_certificate_chain_buffer`
- `wolfSSL_use_certificate_buffer`
- `wolfSSL_use_certificate_chain_buffer`

Return:

- `SSL_SUCCESS` upon success.
- `SSL_BAD_FILETYPE` will be returned if the file is the wrong format.
- `SSL_BAD_FILE` will be returned if the file doesn't exist, can't be read, or is corrupted.
- `MEMORY_E` will be returned if an out of memory condition occurs.
- `ASN_INPUT_E` will be returned if Base16 decoding fails on the file.
- `NO_PASSWORD` will be returned if the key file is encrypted but no password is provided.

Example

```
int buffSz;
int ret;
byte keyBuff[...];
WOLFSSL* ssl = 0;
...
ret = wolfSSL_use_PrivateKey_buffer(ssl, keyBuff, buffSz, SSL_FILETYPE_PEM);
if (ret != SSL_SUCCESS) {
    // failed to load private key from buffer
}
```

17.4.2.64 function wolfSSL_use_certificate_chain_buffer

```
WOLFSSL_API int wolfSSL_use_certificate_chain_buffer(
    WOLFSSL *,
    const unsigned char *,
    long
)
```

This function loads a certificate chain buffer into the WOLFSSL object. It behaves like the non-buffered version, only differing in its ability to be called with a buffer as input instead of a file. The buffer is provided by the *in* argument of size *sz*. The buffer must be in PEM format and start with the subject's certificate, ending with the root certificate. Please see the examples for proper usage.

Parameters:

- **ssl** pointer to the SSL session, created with `wolfSSL_new()`.
- **in** buffer containing certificate to load.
- **sz** size of the certificate located in buffer.

See:

- `wolfSSL_CTX_load_verify_buffer`
- `wolfSSL_CTX_use_certificate_buffer`
- `wolfSSL_CTX_use_PrivateKey_buffer`
- `wolfSSL_CTX_use_certificate_chain_buffer`
- `wolfSSL_use_certificate_buffer`
- `wolfSSL_use_PrivateKey_buffer`

Return:

- `SSL_SUCCESS` upon success.
- `SSL_BAD_FILETYPE` will be returned if the file is the wrong format.
- `SSL_BAD_FILE` will be returned if the file doesn't exist, can't be read, or is corrupted.
- `MEMORY_E` will be returned if an out of memory condition occurs.
- `ASN_INPUT_E` will be returned if Base16 decoding fails on the file.
- `BUFFER_E` will be returned if a chain buffer is bigger than the receiving buffer.

Example

```
int buffSz;
int ret;
byte certChainBuff[...];
WOLFSSL* ssl = 0;
...
ret = wolfSSL_use_certificate_chain_buffer(ssl, certChainBuff, buffSz);
if (ret != SSL_SUCCESS) {
```

```

    // failed to load certificate chain from buffer
}

```

17.4.2.65 function wolfSSL_UnloadCertsKeys

```

WOLFSSL_API int wolfSSL_UnloadCertsKeys(
    WOLFSSL *
)

```

This function unloads any certificates or keys that SSL owns.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using [wolfSSL_new\(\)](#).

See: [wolfSSL_CTX_UnloadCAs](#)

Return:

- SSL_SUCCESS - returned if the function executed successfully.
- BAD_FUNC_ARG - returned if the WOLFSSL object is NULL.

Example

```

WOLFSSL* ssl = wolfSSL_new(ctx);
...
int unloadKeys = wolfSSL_UnloadCertsKeys(ssl);
if(unloadKeys != SSL_SUCCESS){
    // Failure case.
}

```

17.4.2.66 function wolfSSL_GetIVSize

```

WOLFSSL_API int wolfSSL_GetIVSize(
    WOLFSSL *
)

```

Returns the iv_size member of the specs structure held in the WOLFSSL struct.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using [wolfSSL_new\(\)](#).

See:

- [wolfSSL_GetKeySize](#)
- [wolfSSL_GetClientWriteIV](#)
- [wolfSSL_GetServerWriteIV](#)

Return:

- iv_size returns the value held in ssl->specs.iv_size.
- BAD_FUNC_ARG returned if the WOLFSSL structure is NULL.

Example

```

WOLFSSL_CTX* ctx = wolfSSL_CTX_new( method );
WOLFSSL* ssl = wolfSSL_new(ctx);
int ivSize;
...
ivSize = wolfSSL_GetIVSize(ssl);
if(ivSize > 0){

```

```

    // ivSize holds the specs.iv_size value.
}

```

17.4.2.67 function wolfSSL_KeepArrays

```

WOLFSSL_API void wolfSSL_KeepArrays(
    WOLFSSL *
)

```

Normally, at the end of the SSL handshake, wolfSSL frees temporary arrays. Calling this function before the handshake begins will prevent wolfSSL from freeing temporary arrays. Temporary arrays may be needed for things such as wolfSSL_get_keys() or PSK hints. When the user is done with temporary arrays, either wolfSSL_FreeArrays() may be called to free the resources immediately, or alternatively the resources will be freed when the associated SSL object is freed.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using [wolfSSL_new\(\)](#).

See: [wolfSSL_FreeArrays](#)

Return: none No return.

Example

```

WOLFSSL* ssl;
...
wolfSSL_KeepArrays(ssl);

```

17.4.2.68 function wolfSSL_FreeArrays

```

WOLFSSL_API void wolfSSL_FreeArrays(
    WOLFSSL *
)

```

Normally, at the end of the SSL handshake, wolfSSL frees temporary arrays. If [wolfSSL_KeepArrays\(\)](#) has been called before the handshake, wolfSSL will not free temporary arrays. This function explicitly frees temporary arrays and should be called when the user is done with temporary arrays and does not want to wait for the SSL object to be freed to free these resources.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using [wolfSSL_new\(\)](#).

See: [wolfSSL_KeepArrays](#)

Return: none No return.

Example

```

WOLFSSL* ssl;
...
wolfSSL_FreeArrays(ssl);

```

17.4.2.69 function wolfSSL_DeriveTlsKeys

```

WOLFSSL_API int wolfSSL_DeriveTlsKeys(
    unsigned char * key_data,
    word32 keyLen,
    const unsigned char * ms,
    word32 msLen,

```

```

    const unsigned char * sr,
    const unsigned char * cr,
    int tls1_2,
    int hash_type
)

```

An external facing wrapper to derive TLS Keys.

Parameters:

- **key_data** a byte pointer that is allocated in DeriveTlsKeys and passed through to wc_PRf to hold the final hash.
- **keyLen** a word32 type that is derived in DeriveTlsKeys from the WOLFSSL structure's specs member.
- **ms** a constant pointer type holding the master secret held in the arrays structure within the WOLFSSL structure.
- **msLen** a word32 type that holds the length of the master secret in an enumerated define, SECRET_LEN.
- **sr** a constant byte pointer to the serverRandom member of the arrays structure within the WOLFSSL structure.
- **cr** a constant byte pointer to the clientRandom member of the arrays structure within the WOLFSSL structure.
- **tls1_2** an integer type returned from IsAtLeastTLsv1_2().
- **hash_type** an integer type held in the WOLFSSL structure.

See:

- wc_PRf
- DeriveTlsKeys
- IsAtLeastTLsv1_2

Return:

- 0 returned on success.
- BUFFER_E returned if the sum of labLen and seedLen (computes total size) exceeds the maximum size.
- MEMORY_E returned if the allocation of memory failed.

Example

```

int DeriveTlsKeys(WOLFSSL* ssl){
int ret;
...
ret = wolfSSL_DeriveTlsKeys(key_data, length, ssl->arrays->masterSecret,
SECRET_LEN, ssl->arrays->clientRandom,
IsAtLeastTLsv1_2(ssl), ssl->specs.mac_algorithm);
...
}

```

17.4.2.70 function wolfSSL_X509_get_ext_by_NID

```

WOLFSSL_API int wolfSSL_X509_get_ext_by_NID(
    const WOLFSSL_X509 * x509,
    int nid,
    int lastPos
)

```

This function looks for and returns the extension index matching the passed in NID value.

Parameters:

- **x509** certificate to get parse through for extension.
- **nid** extension OID to be found.
- **lastPos** start search from extension after lastPos. Set to -1 initially.

Return:

- = 0 If successful the extension index is returned.
- -1 If extension is not found or error is encountered.

Example

```
const WOLFSSL_X509* x509;
int lastPos = -1;
int idx;
```

```
idx = wolfSSL_X509_get_ext_by_NID(x509, NID_basic_constraints, lastPos);
```

17.4.2.71 function wolfSSL_X509_get_ext_d2i

```
WOLFSSL_API void * wolfSSL_X509_get_ext_d2i(
    const WOLFSSL_X509 * x509,
    int nid,
    int * c,
    int * idx
)
```

This function looks for and returns the extension matching the passed in NID value.

Parameters:

- **x509** certificate to get parse through for extension.
- **nid** extension OID to be found.
- **c** if not NULL is set to -2 for multiple extensions found -1 if not found, 0 if found and not critical and 1 if found and critical.
- **idx** if NULL return first extension matched otherwise if not stored in x509 start at idx.

See: wolfSSL_sk_ASN1_OBJECT_free

Return:

- pointer If successful a STACK_OF(WOLFSSL_ASN1_OBJECT) pointer is returned.
- NULL If extension is not found or error is encountered.

Example

```
const WOLFSSL_X509* x509;
int c;
int idx = 0;
STACK_OF(WOLFSSL_ASN1_OBJECT)* sk;
```

```
sk = wolfSSL_X509_get_ext_d2i(x509, NID_basic_constraints, &c, &idx);
//check sk for NULL and then use it. sk needs freed after done.
```

17.4.2.72 function wolfSSL_X509_digest

```
WOLFSSL_API int wolfSSL_X509_digest(
    const WOLFSSL_X509 * x509,
    const WOLFSSL_EVP_MD * digest,
    unsigned char * buf,
    unsigned int * len
)
```

)

This function returns the hash of the DER certificate.

Parameters:

- **x509** certificate to get the hash of.
- **digest** the hash algorithm to use.
- **buf** buffer to hold hash.
- **len** length of buffer.

See: none

Return:

- **SSL_SUCCESS** On successfully creating a hash.
- **SSL_FAILURE** Returned on bad input or unsuccessful hash.

Example

```
WOLFSSL_X509* x509;
unsigned char buffer[64];
unsigned int bufferSz;
int ret;

ret = wolfSSL_X509_digest(x509, wolfSSL_EVP_sha256(), buffer, &bufferSz);
//check ret value
```

17.4.2.73 function **wolfSSL_use_PrivateKey**

```
WOLFSSL_API int wolfSSL_use_PrivateKey(
    WOLFSSL * ssl,
    WOLFSSL_EVP_PKEY * pkey
)
```

This is used to set the private key for the WOLFSSL structure.

Parameters:

- **ssl** WOLFSSL structure to set argument in.
- **pkey** private key to use.

See:

- **wolfSSL_new**
- **wolfSSL_free**

Return:

- **SSL_SUCCESS** On successful setting argument.
- **SSL_FAILURE** If a NULL ssl passed in. All error cases will be negative values.

Example

```
WOLFSSL* ssl;
WOLFSSL_EVP_PKEY* pkey;
int ret;
// create ssl object and set up private key
ret = wolfSSL_use_PrivateKey(ssl, pkey);
// check ret value
```

17.4.2.74 function wolfSSL_use_PrivateKey_ASN1

```
WOLFSSL_API int wolfSSL_use_PrivateKey_ASN1(  
    int pri,  
    WOLFSSL * ssl,  
    unsigned char * der,  
    long derSz  
)
```

This is used to set the private key for the WOLFSSL structure. A DER formatted key buffer is expected.

Parameters:

- **pri** type of private key.
- **ssl** WOLFSSL structure to set argument in.
- **der** buffer holding DER key.
- **derSz** size of der buffer.

See:

- [wolfSSL_new](#)
- [wolfSSL_free](#)
- [wolfSSL_use_PrivateKey](#)

Return:

- SSL_SUCCESS On successful setting parsing and setting the private key.
- SSL_FAILURE If an NULL ssl passed in. All error cases will be negative values.

Example

```
WOLFSSL* ssl;  
unsigned char* pkey;  
long pkeySz;  
int ret;  
// create ssl object and set up private key  
ret = wolfSSL_use_PrivateKey_ASN1(1, ssl, pkey, pkeySz);  
// check ret value
```

17.4.2.75 function wolfSSL_use_RSAPrivateKey_ASN1

```
WOLFSSL_API int wolfSSL_use_RSAPrivateKey_ASN1(  
    WOLFSSL * ssl,  
    unsigned char * der,  
    long derSz  
)
```

This is used to set the private key for the WOLFSSL structure. A DER formatted RSA key buffer is expected.

Parameters:

- **ssl** WOLFSSL structure to set argument in.
- **der** buffer holding DER key.
- **derSz** size of der buffer.

See:

- [wolfSSL_new](#)
- [wolfSSL_free](#)
- [wolfSSL_use_PrivateKey](#)

Return:

- SSL_SUCCESS On successful setting parsing and setting the private key.
- SSL_FAILURE If an NULL ssl passed in. All error cases will be negative values.

Example

```
WOLFSSL* ssl;
unsigned char* pkey;
long pkeySz;
int ret;
// create ssl object and set up RSA private key
ret = wolfSSL_use_RSAPrivateKey_ASN1(ssl, pkey, pkeySz);
// check ret value
```

17.4.2.76 function wolfSSL_DSA_dup_DH

```
WOLFSSL_API WOLFSSL_DH * wolfSSL_DSA_dup_DH(
    const WOLFSSL_DSA * r
)
```

This function duplicates the parameters in dsa to a newly created WOLFSSL_DH structure.

Parameters:

- **dsa** WOLFSSL_DSA structure to duplicate.

See: none

Return:

- WOLFSSL_DH If duplicated returns WOLFSSL_DH structure
- NULL upon failure

Example

```
WOLFSSL_DH* dh;
WOLFSSL_DSA* dsa;
// set up dsa
dh = wolfSSL_DSA_dup_DH(dsa);

// check dh is not null
```

17.4.2.77 function wolfSSL_d2i_X509_bio

```
WOLFSSL_X509 * wolfSSL_d2i_X509_bio(
    WOLFSSL_BIO * bio,
    WOLFSSL_X509 ** x509
)
```

This function get the DER buffer from bio and converts it to a WOLFSSL_X509 structure.

Parameters:

- **bio** pointer to the WOLFSSL_BIO structure that has the DER certificate buffer.
- **x509** pointer that get set to new WOLFSSL_X509 structure created.

See: none

Return:

- pointer returns a WOLFSSL_X509 structure pointer on success.
- Null returns NULL on failure

Example

```
WOLFSSL_BIO* bio;
WOLFSSL_X509* x509;
// load DER into bio
x509 = wolfSSL_d2i_X509_bio(bio, NULL);
Or
wolfSSL_d2i_X509_bio(bio, &x509);
// use x509 returned (check for NULL)
```

17.4.2.78 function wolfSSL_PEM_read_bio_X509_AUX

```
WOLFSSL_API WOLFSSL_X509 * wolfSSL_PEM_read_bio_X509_AUX(
    WOLFSSL_BIO * bp,
    WOLFSSL_X509 ** x,
    wc_pem_password_cb * cb,
    void * u
)
```

This function behaves the same as `wolfSSL_PEM_read_bio_X509`. AUX signifies containing extra information such as trusted/rejected use cases and friendly name for human readability.

Parameters:

- **bp** WOLFSSL_BIO structure to get PEM buffer from.
- **x** if setting WOLFSSL_X509 by function side effect.
- **cb** password callback.
- **u** NULL terminated user password.

See: `wolfSSL_PEM_read_bio_X509`

Return:

- WOLFSSL_X509 on successfully parsing the PEM buffer a WOLFSSL_X509 structure is returned.
- Null if failed to parse PEM buffer.

Example

```
WOLFSSL_BIO* bio;
WOLFSSL_X509* x509;
// setup bio
X509 = wolfSSL_PEM_read_bio_X509_AUX(bio, NULL, NULL, NULL);
//check x509 is not null and then use it
```

17.4.2.79 function wolfSSL_CTX_set_tmp_dh

```
WOLFSSL_API long wolfSSL_CTX_set_tmp_dh(
    WOLFSSL_CTX * ,
    WOLFSSL_DH *
)
```

Initializes the WOLFSSL_CTX structure's dh member with the Diffie-Hellman parameters.

Parameters:

- **ctx** a pointer to a WOLFSSL_CTX structure, created using `wolfSSL_CTX_new()`.
- **dh** a pointer to a WOLFSSL_DH structure.

See: `wolfSSL_BN_bn2bin`

Return:

- SSL_SUCCESS returned if the function executed successfully.
- BAD_FUNC_ARG returned if the ctx or dh structures are NULL.
- SSL_FATAL_ERROR returned if there was an error setting a structure value.
- MEMORY_E returned if there was a failure to allocate memory.

Example

```
WOLFSSL_CTX* ctx = wolfSSL_CTX_new( protocol method );
WOLFSSL_DH* dh;
...
return wolfSSL_CTX_set_tmp_dh(ctx, dh);
```

17.4.2.80 function wolfSSL_PEM_read_bio_DSAParams

```
WOLFSSL_API WOLFSSL_DSA * wolfSSL_PEM_read_bio_DSAParams(
    WOLFSSL_BIO * bp,
    WOLFSSL_DSA ** x,
    wc_pem_password_cb * cb,
    void * u
)
```

This function gets the DSA parameters from a PEM buffer in bio.

Parameters:

- **bio** pointer to the WOLFSSL_BIO structure for getting PEM memory pointer.
- **x** pointer to be set to new WOLFSSL_DSA structure.
- **cb** password callback function.
- **u** null terminated password string.

See: none

Return:

- WOLFSSL_DSA on successfully parsing the PEM buffer a WOLFSSL_DSA structure is created and returned.
- Null if failed to parse PEM buffer.

Example

```
WOLFSSL_BIO* bio;
WOLFSSL_DSA* dsa;
// setup bio
dsa = wolfSSL_PEM_read_bio_DSAParams(bio, NULL, NULL, NULL);

// check dsa is not NULL and then use dsa
```

17.4.2.81 function WOLF_STACK_OF

```
WOLFSSL_API WOLF_STACK_OF(
    WOLFSSL_X509
) const
```

This function gets the peer's certificate chain.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using **wolfSSL_new()**.

See:

- **wolfSSL_X509_get_issuer_name**

- `wolfSSL_X509_get_subject_name`
- `wolfSSL_X509_get_isCA`

Return:

- pointer returns a pointer to the peer's Certificate stack.
- NULL returned if no peer certificate.

Example

```
WOLFSSL_CTX* ctx = wolfSSL_CTX_new( method );
WOLFSSL* ssl = wolfSSL_new(ctx);
...
wolfSSL_connect(ssl);
STACK_OF(WOLFSSL_X509)* chain = wolfSSL_get_peer_cert_chain(ssl);
if(chain){
    // You have a pointer to the peer certificate chain
}
```

17.4.2.82 function `wolfSSL_X509_get_next_altname`

```
WOLFSSL_API char * wolfSSL_X509_get_next_altname(
    WOLFSSL_X509 *
```

This function returns the next, if any, altname from the peer certificate.

Parameters:

- **cert** a pointer to the `wolfSSL_X509` structure.

See:

- `wolfSSL_X509_get_issuer_name`
- `wolfSSL_X509_get_subject_name`

Return:

- NULL if there is not a next altname.
- `cert->altNamesNext->name` from the `WOLFSSL_X509` structure that is a string value from the altName list is returned if it exists.

Example

```
WOLFSSL_X509 x509 = (WOLFSSL_X509*)XMALLOC(sizeof(WOLFSSL_X509), NULL,
                                           DYNAMIC_TYPE_X509);

...
int x509NextAltName = wolfSSL_X509_get_next_altname(x509);
if(x509NextAltName == NULL){
    //There isn't another alt name
}
```

17.4.2.83 function `wolfSSL_X509_get_notBefore`

```
WOLFSSL_API WOLFSSL_ASN1_TIME * wolfSSL_X509_get_notBefore(
    WOLFSSL_X509 *
```

The function checks to see if `x509` is NULL and if it's not, it returns the `notBefore` member of the `x509` struct.

Parameters:

- **x509** a pointer to the WOLFSSL_X509 struct.

See: [wolfSSL_X509_get_notAfter](#)

Return:

- pointer to struct with ASN1_TIME to the notBefore member of the x509 struct.
- NULL the function returns NULL if the x509 structure is NULL.

Example

```
WOLFSSL_X509* x509 = (WOLFSSL_X509)XMALLOC(sizeof(WOLFSSL_X509), NULL,
DYNAMIC_TYPE_X509) ;

...
const WOLFSSL_ASN1_TIME* notAfter = wolfSSL_X509_get_notBefore(x509);
if(notAfter == NULL){
    //The x509 object was NULL
}
```

17.5.2 Functions Documentation

17.5.2.1 function wolfSSL_get_verify_depth

```
WOLFSSL_API long wolfSSL_get_verify_depth(
    WOLFSSL * ssl
)
```

This function returns the maximum chain depth allowed, which is 9 by default, for a valid session i.e. there is a non-null session object (ssl).

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using `wolfSSL_new()`.

See: `wolfSSL_CTX_get_verify_depth`

Return:

- MAX_CHAIN_DEPTH returned if the WOLFSSL_CTX structure is not NULL. By default the value is 9.
- BAD_FUNC_ARG returned if the WOLFSSL_CTX structure is NULL.

Example

```
WOLFSSL_CTX* ctx = wolfSSL_CTX_new( protocol method );
WOLFSSL* ssl = wolfSSL_new(ctx);
...
long sslDep = wolfSSL_get_verify_depth(ssl);

if(sslDep > EXPECTED){
    // The verified depth is greater than what was expected
} else {
    // The verified depth is smaller or equal to the expected value
}
```

17.5.2.2 function wolfSSL_get_cipher_list

```
WOLFSSL_API char * wolfSSL_get_cipher_list(
    int priority
)
```

Get the name of cipher at priority level passed in.

Parameters:

- **priority** Integer representing the priority level of a cipher.

See:

- `wolfSSL_CIPHER_get_name`
- `wolfSSL_get_current_cipher`

Return:

- string Success
- 0 Priority is either out of bounds or not valid.

Example

```
printf("The cipher at 1 is %s", wolfSSL_get_cipher_list(1));
```

17.5.2.3 function wolfSSL_get_ciphers

```
WOLFSSL_API int wolfSSL_get_ciphers(
    char * ,
    int
)
```

This function gets the ciphers enabled in wolfSSL.

Parameters:

- **buf** a char pointer representing the buffer.

- **len** the length of the buffer.

See:

- GetCipherNames
- [wolfSSL_get_cipher_list](#)
- ShowCiphers

Return:

- SSL_SUCCESS returned if the function executed without error.
- BAD_FUNC_ARG returned if the buf parameter was NULL or if the len argument was less than or equal to zero.
- BUFFER_E returned if the buffer is not large enough and will overflow.

Example

```
static void ShowCiphers(void){
char* ciphers;
int ret = wolfSSL_get_ciphers(ciphers, (int)sizeof(ciphers));

if(ret == SSL_SUCCESS){
    printf("%s\n", ciphers);
}
}
```

17.5.2.4 function wolfSSL_get_cipher_name

```
WOLFSSL_API const char * wolfSSL_get_cipher_name(
    WOLFSSL * ssl
)
```

This function gets the cipher name in the format DHE-RSA by passing through argument to wolfSSL_get_cipher_name_internal.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using [wolfSSL_new\(\)](#).

See:

- [wolfSSL_CIPHER_get_name](#)
- [wolfSSL_get_current_cipher](#)
- [wolfSSL_get_cipher_name_internal](#)

Return:

- string This function returns the string representation of the cipher suite that was matched.
- NULL error or cipher not found.

Example

```
WOLFSSL_CTX* ctx = wolfSSL_CTX_new( protocol method );
WOLFSSL* ssl = wolfSSL_new(ctx);
...
char* cipherS = wolfSSL_get_cipher_name(ssl);

if(cipher == NULL){
    // There was not a cipher suite matched
} else {
    // There was a cipher suite matched
```

```
    printf("%s\n", cipherS);
}
```

17.5.2.5 function wolfSSL_get_fd

```
WOLFSSL_API int wolfSSL_get_fd(
    const WOLFSSL *
```

This function returns the file descriptor (fd) used as the input/output facility for the SSL connection. Typically this will be a socket file descriptor.

Parameters:

- **ssl** pointer to the SSL session, created with `wolfSSL_new()`.

See: `wolfSSL_set_fd`

Return: fd If successful the call will return the SSL session file descriptor.

Example

```
int sockfd;
WOLFSSL* ssl = 0;
...
sockfd = wolfSSL_get_fd(ssl);
...
```

17.5.2.6 function wolfSSL_get_using_nonblock

```
WOLFSSL_API int wolfSSL_get_using_nonblock(
    WOLFSSL *
```

This function allows the application to determine if wolfSSL is using non-blocking I/O. If wolfSSL is using non-blocking I/O, this function will return 1, otherwise 0. After an application creates a WOLFSSL object, if it will be used with a non-blocking socket, call `wolfSSL_set_using_nonblock()` on it. This lets the WOLFSSL object know that receiving EWOULDBLOCK means that the `recvfrom` call would block rather than that it timed out.

Parameters:

- **ssl** pointer to the SSL session, created with `wolfSSL_new()`.

See: `wolfSSL_set_session`

Return:

- 0 underlying I/O is blocking.
- 1 underlying I/O is non-blocking.

Example

```
int ret = 0;
WOLFSSL* ssl = 0;
...
ret = wolfSSL_get_using_nonblock(ssl);
if (ret == 1) {
    // underlying I/O is non-blocking
}
...
```

17.5.2.7 function wolfSSL_write

```
WOLFSSL_API int wolfSSL_write(  
    WOLFSSL * ,  
    const void * ,  
    int  
)
```

This function writes `sz` bytes from the buffer, `data`, to the SSL connection, `ssl`. If necessary, `wolfSSL_write()` will negotiate an SSL/TLS session if the handshake has not already been performed yet by `wolfSSL_connect()` or `wolfSSL_accept()`. `wolfSSL_write()` works with both blocking and non-blocking I/O. When the underlying I/O is non-blocking, `wolfSSL_write()` will return when the underlying I/O could not satisfy the needs of `wolfSSL_write()` to continue. In this case, a call to `wolfSSL_get_error()` will yield either `SSL_ERROR_WANT_READ` or `SSL_ERROR_WANT_WRITE`. The calling process must then repeat the call to `wolfSSL_write()` when the underlying I/O is ready. If the underlying I/O is blocking, `wolfSSL_write()` will only return once the buffer data of size `sz` has been completely written or an error occurred.

Parameters:

- **ssl** pointer to the SSL session, created with `wolfSSL_new()`.
- **data** data buffer which will be sent to peer.
- **sz** size, in bytes, of data to send to the peer (`data`).

See:

- `wolfSSL_send`
- `wolfSSL_read`
- `wolfSSL_recv`

Return:

- 0 the number of bytes written upon success.
- 0 will be returned upon failure. Call `wolfSSL_get_error()` for the specific error code.
- `SSL_FATAL_ERROR` will be returned upon failure when either an error occurred or, when using non-blocking sockets, the `SSL_ERROR_WANT_READ` or `SSL_ERROR_WANT_WRITE` error was received and the application needs to call `wolfSSL_write()` to get a specific error code.

Example

```
WOLFSSL* ssl = 0;  
char msg[64] = "hello wolfssl!";  
int msgSz = (int)strlen(msg);  
int flags;  
int ret;  
...  
  
ret = wolfSSL_write(ssl, msg, msgSz);  
if (ret <= 0) {  
    // wolfSSL_write() failed, call wolfSSL_get_error()  
}
```

17.5.2.8 function wolfSSL_read

```
WOLFSSL_API int wolfSSL_read(  
    WOLFSSL * ,  
    void * ,  
    int
```

)

This function reads `sz` bytes from the SSL session (`ssl`) internal read buffer into the buffer data. The bytes read are removed from the internal receive buffer. If necessary `wolfSSL_read()` will negotiate an SSL/TLS session if the handshake has not already been performed yet by `wolfSSL_connect()` or `wolfSSL_accept()`. The SSL/TLS protocol uses SSL records which have a maximum size of 16kB (the max record size can be controlled by the `MAX_RECORD_SIZE` define in `<wolfssl_root>/wolfssl/internal.h`). As such, `wolfSSL` needs to read an entire SSL record internally before it is able to process and decrypt the record. Because of this, a call to `wolfSSL_read()` will only be able to return the maximum buffer size which has been decrypted at the time of calling. There may be additional not-yet-decrypted data waiting in the internal `wolfSSL` receive buffer which will be retrieved and decrypted with the next call to `wolfSSL_read()`. If `sz` is larger than the number of bytes in the internal read buffer, `SSL_read()` will return the bytes available in the internal read buffer. If no bytes are buffered in the internal read buffer yet, a call to `wolfSSL_read()` will trigger processing of the next record.

Parameters:

- **ssl** pointer to the SSL session, created with `wolfSSL_new()`.
- **data** buffer where `wolfSSL_read()` will place data read.
- **sz** number of bytes to read into data.

See:

- `wolfSSL_recv`
- `wolfSSL_write`
- `wolfSSL_peek`
- `wolfSSL_pending`

Return:

- 0 the number of bytes read upon success.
- 0 will be returned upon failure. This may be caused by either a clean (close notify alert) shutdown or just that the peer closed the connection. Call `wolfSSL_get_error()` for the specific error code.
- `SSL_FATAL_ERROR` will be returned upon failure when either an error occurred or, when using non-blocking sockets, the `SSL_ERROR_WANT_READ` or `SSL_ERROR_WANT_WRITE` error was received and the application needs to call `wolfSSL_read()` to get a specific error code.

Example

```
WOLFSSL* ssl = 0;
char reply[1024];
...

input = wolfSSL_read(ssl, reply, sizeof(reply));
if (input > 0) {
    // "input" number of bytes returned into buffer "reply"
}
```

See `wolfSSL` examples (`client`, `server`, `echoclient`, `echoserver`) **for** more complete examples of `wolfSSL_read()`.

17.5.2.9 function `wolfSSL_peek`

```
WOLFSSL_API int wolfSSL_peek(
    WOLFSSL *,
    void *,
    int
```

)

This function copies `sz` bytes from the SSL session (`ssl`) internal read buffer into the buffer `data`. This function is identical to `wolfSSL_read()`. If `sz` is larger than the number of bytes in the internal read buffer, `SSL_peek()` will return the bytes available in the internal read buffer. If no bytes are buffered in the internal read buffer yet, a call to `wolfSSL_peek()` will trigger processing of the next record.

Parameters:

- **ssl** pointer to the SSL session, created with `wolfSSL_new()`.
- **data** buffer where `wolfSSL_peek()` will place data read.
- **sz** number of bytes to read into data.

See: `wolfSSL_read`

Return:

- 0 the number of bytes read upon success.
- 0 will be returned upon failure. This may be caused by either a clean (close notify alert) shutdown or just that the peer closed the connection. Call `wolfSSL_get_error()` for the specific error code.
- `SSL_FATAL_ERROR` will be returned upon failure when either an error occurred or, when using non-blocking sockets, the `SSL_ERROR_WANT_READ` or `SSL_ERROR_WANT_WRITE` error was received and the application needs to call `wolfSSL_peek()` to get a specific error code.

Example

```
WOLFSSL* ssl = 0;
char reply[1024];
...

input = wolfSSL_peek(ssl, reply, sizeof(reply));
if (input > 0) {
    // "input" number of bytes returned into buffer "reply"
}
```

17.5.2.10 function `wolfSSL_accept`

```
WOLFSSL_API int wolfSSL_accept(
    WOLFSSL *
)
```

This function is called on the server side and waits for an SSL client to initiate the SSL/TLS handshake. When this function is called, the underlying communication channel has already been set up. `wolfSSL_accept()` works with both blocking and non-blocking I/O. When the underlying I/O is non-blocking, `wolfSSL_accept()` will return when the underlying I/O could not satisfy the needs of `wolfSSL_accept` to continue the handshake. In this case, a call to `wolfSSL_get_error()` will yield either `SSL_ERROR_WANT_READ` or `SSL_ERROR_WANT_WRITE`. The calling process must then repeat the call to `wolfSSL_accept` when data is available to read and `wolfSSL` will pick up where it left off. When using a non_blocking socket, nothing needs to be done, but `select()` can be used to check for the required condition. If the underlying I/O is blocking, `wolfSSL_accept()` will only return once the handshake has been finished or an error occurred.

Parameters:

- **ssl** a pointer to a `WOLFSSL` structure, created using `wolfSSL_new()`.

See:

- `wolfSSL_get_error`

- [wolfSSL_connect](#)

Return:

- SSL_SUCCESS upon success.
- SSL_FATAL_ERROR will be returned if an error occurred. To get a more detailed error code, call [wolfSSL_get_error\(\)](#).

Example

```
int ret = 0;
int err = 0;
WOLFSSL* ssl;
char buffer[80];
...

ret = wolfSSL_accept(ssl);
if (ret != SSL_SUCCESS) {
    err = wolfSSL_get_error(ssl, ret);
    printf("error = %d, %s\n", err, wolfSSL_ERR_error_string(err, buffer));
}
```

17.5.2.11 function [wolfSSL_send](#)

```
WOLFSSL_API int wolfSSL_send(
    WOLFSSL *,
    const void *,
    int sz,
    int flags
)
```

This function writes `sz` bytes from the buffer, `data`, to the SSL connection, `ssl`, using the specified flags for the underlying write operation. If necessary `wolfSSL_send()` will negotiate an SSL/TLS session if the handshake has not already been performed yet by `wolfSSL_connect()` or [wolfSSL_accept\(\)](#) will yield either `SSL_ERROR_WANT_READ` or `SSL_ERROR_WANT_WRITE`. The calling process must then repeat the call to `wolfSSL_send()` when the underlying I/O is ready. If the underlying I/O is blocking, `wolfSSL_send()` will only return once the buffer data of size `sz` has been completely written or an error occurred.

Parameters:

- **ssl** pointer to the SSL session, created with [wolfSSL_new\(\)](#).
- **data** data buffer to send to peer.
- **sz** size, in bytes, of data to be sent to peer.
- **flags** the send flags to use for the underlying send operation.

See:

- [wolfSSL_write](#)
- [wolfSSL_read](#)
- [wolfSSL_recv](#)

Return:

- 0 the number of bytes written upon success.
- 0 will be returned upon failure. Call [wolfSSL_get_error\(\)](#) for the specific error code.
- SSL_FATAL_ERROR will be returned upon failure when either an error occurred or, when using non-blocking sockets, the `SSL_ERROR_WANT_READ` or `SSL_ERROR_WANT_WRITE` error was received and the application needs to call [wolfSSL_send\(\)](#) to get a specific error code.

Example

```
WOLFSSL* ssl = 0;
char msg[64] = "hello wolfssl!";
int msgSz = (int)strlen(msg);
int flags = ... ;
...

input = wolfSSL_send(ssl, msg, msgSz, flags);
if (input != msgSz) {
    // wolfSSL_send() failed
}
```

17.5.2.12 function wolfSSL_recv

```
WOLFSSL_API int wolfSSL_recv(
    WOLFSSL * ,
    void * ,
    int sz,
    int flags
)
```

This function reads `sz` bytes from the SSL session (`ssl`) internal read buffer into the buffer data using the specified flags for the underlying `recv` operation. The bytes read are removed from the internal receive buffer. This function is identical to `wolfSSL_read()`. The SSL/TLS protocol uses SSL records which have a maximum size of 16kB (the max record size can be controlled by the `MAX_RECORD_SIZE` define in `<wolfssl_root>/wolfssl/internal.h`). As such, wolfSSL needs to read an entire SSL record internally before it is able to process and decrypt the record. Because of this, a call to `wolfSSL_recv()` will only be able to return the maximum buffer size which has been decrypted at the time of calling. There may be additional not_yet_decrypted data waiting in the internal wolfSSL receive buffer which will be retrieved and decrypted with the next call to `wolfSSL_recv()`. If `sz` is larger than the number of bytes in the internal read buffer, `SSL_recv()` will return the bytes available in the internal read buffer. If no bytes are buffered in the internal read buffer yet, a call to `wolfSSL_recv()` will trigger processing of the next record.

Parameters:

- **ssl** pointer to the SSL session, created with `wolfSSL_new()`.
- **data** buffer where `wolfSSL_recv()` will place data read.
- **sz** number of bytes to read into data.
- **flags** the `recv` flags to use for the underlying `recv` operation.

See:

- `wolfSSL_read`
- `wolfSSL_write`
- `wolfSSL_peek`
- `wolfSSL_pending`

Return:

- 0 the number of bytes read upon success.
- 0 will be returned upon failure. This may be caused by a either a clean (close notify alert) shutdown or just that the peer closed the connection. Call `wolfSSL_get_error()` for the specific error code.
- `SSL_FATAL_ERROR` will be returned upon failure when either an error occurred or, when using non-blocking sockets, the `SSL_ERROR_WANT_READ` or `SSL_ERROR_WANT_WRITE` error was received

and the application needs to call `wolfSSL_recv()` to get a specific error code.

Example

```
WOLFSSL* ssl = 0;
char reply[1024];
int flags = ... ;
...

input = wolfSSL_recv(ssl, reply, sizeof(reply), flags);
if (input > 0) {
    // "input" number of bytes returned into buffer "reply"
}
```

17.5.2.13 function `wolfSSL_get_alert_history`

```
WOLFSSL_API int wolfSSL_get_alert_history(
    WOLFSSL *,
    WOLFSSL_ALERT_HISTORY *
)
```

This function gets the alert history.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using `wolfSSL_new()`.
- **h** a pointer to a WOLFSSL_ALERT_HISTORY structure that will hold the WOLFSSL struct's alert_history member's value.

See: `wolfSSL_get_error`

Return: SSL_SUCCESS returned when the function completed successfully. Either there was alert history or there wasn't, either way, the return value is SSL_SUCCESS.

Example

```
WOLFSSL_CTX* ctx = wolfSSL_CTX_new(protocol method);
WOLFSSL* ssl = wolfSSL_new(ctx);
WOLFSSL_ALERT_HISTORY* h;
...
wolfSSL_get_alert_history(ssl, h);
// h now has a copy of the ssl->alert_history contents
```

17.5.2.14 function `wolfSSL_get_session`

```
WOLFSSL_API WOLFSSL_SESSION * wolfSSL_get_session(
    WOLFSSL *
)
```

This function returns a pointer to the current session (WOLFSSL_SESSION) used in ssl. The WOLFSSL_SESSION pointed to contains all the necessary information required to perform a session resumption and reestablish the connection without a new handshake. For session resumption, before calling `wolfSSL_shutdown()` with your session object, an application should save the session ID from the object with a call to `wolfSSL_get_session()`, which returns a pointer to the session. Later, the application should create a new WOLFSSL object and assign the saved session with `wolfSSL_set_session()`. At this point, the application may call `wolfSSL_connect()` and wolfSSL will try to resume the session. The wolfSSL server code allows session resumption by default.

Parameters:

- **ssl** pointer to the SSL session, created with `wolfSSL_new()`.

See: `wolfSSL_set_session`

Return:

- pointer If successful the call will return a pointer to the the current SSL session object.
- NULL will be returned if ssl is NULL, the SSL session cache is disabled, wolfSSL doesn't have the Session ID available, or mutex functions fail.

Example

```
WOLFSSL* ssl = 0;
WOLFSSL_SESSION* session = 0;
...
session = wolfSSL_get_session(ssl);
if (session == NULL) {
    // failed to get session pointer
}
...
```

17.5.2.15 function `wolfSSL_flush_sessions`

```
WOLFSSL_API void wolfSSL_flush_sessions(
    WOLFSSL_CTX * ,
    long
)
```

This function flushes session from the session cache which have expired. The time, tm, is used for the time comparison. Note that wolfSSL currently uses a static table for sessions, so no flushing is needed. As such, this function is currently just a stub. This function provides OpenSSL compatibility (`SSL_flush_sessions`) when wolfSSL is compiled with the OpenSSL compatibility layer.

Parameters:

- **ctx** a pointer to a WOLFSSL_CTX structure, created using `wolfSSL_CTX_new()`.
- **tm** time used in session expiration comparison.

See:

- `wolfSSL_get_session`
- `wolfSSL_set_session`

Return: none No returns.

Example

```
WOLFSSL_CTX* ssl;
...
wolfSSL_flush_sessions(ctx, time(0));
```

17.5.2.16 function `wolfSSL_GetSessionIndex`

```
WOLFSSL_API int wolfSSL_GetSessionIndex(
    WOLFSSL * ssl
)
```

This function gets the session index of the WOLFSSL structure.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using `wolfSSL_new()`.

See: [wolfSSL_GetSessionAtIndex](#)

Return: int The function returns an int type representing the sessionIndex within the WOLFSSL struct.

Example

```
WOLFSSL_CTX_new( protocol method );
WOLFSSL* ssl = WOLFSSL_new(ctx);
...
int sesIdx = wolfSSL_GetSessionIndex(ssl);

if(sesIdx < 0 || sesIdx > sizeof(ssl->sessionIndex)/sizeof(int)){
    // You have an out of bounds index number and something is not right.
}
```

17.5.2.17 function wolfSSL_GetSessionAtIndex

```
WOLFSSL_API int wolfSSL_GetSessionAtIndex(
    int index,
    WOLFSSL_SESSION * session
)
```

This function gets the session at specified index of the session cache and copies it into memory. The WOLFSSL_SESSION structure holds the session information.

Parameters:

- **idx** an int type representing the session index.
- **session** a pointer to the WOLFSSL_SESSION structure.

See:

- UnLockMutex
- LockMutex
- [wolfSSL_GetSessionIndex](#)

Return:

- SSL_SUCCESS returned if the function executed successfully and no errors were thrown.
- BAD_MUTEX_E returned if there was an unlock or lock mutex error.
- SSL_FAILURE returned if the function did not execute successfully.

Example

```
int idx; // The index to locate the session.
WOLFSSL_SESSION* session; // Buffer to copy to.
...
if(wolfSSL_GetSessionAtIndex(idx, session) != SSL_SUCCESS){
    // Failure case.
}
```

17.5.2.18 function wolfSSL_SESSION_get_peer_chain

```
WOLFSSL_API WOLFSSL_X509_CHAIN * wolfSSL_SESSION_get_peer_chain(
    WOLFSSL_SESSION * session
)
```

Returns the peer certificate chain from the WOLFSSL_SESSION struct.

Parameters:

- **session** a pointer to a WOLFSSL_SESSION structure.

See:

- `wolfSSL_GetSessionAtIndex`
- `wolfSSL_GetSessionIndex`
- `AddSession`

Return: pointer A pointer to a `WOLFSSL_X509_CHAIN` structure that contains the peer certification chain.

Example

```
WOLFSSL_SESSION* session;
WOLFSSL_X509_CHAIN* chain;
...
chain = wolfSSL_SESSION_get_peer_chain(session);
if(!chain){
    // There was no chain. Failure case.
}
```

17.5.2.19 function `wolfSSL_pending`

```
WOLFSSL_API int wolfSSL_pending(
    WOLFSSL *
)
```

This function returns the number of bytes which are buffered and available in the SSL object to be read by `wolfSSL_read()`.

Parameters:

- **ssl** pointer to the SSL session, created with `wolfSSL_new()`.

See:

- `wolfSSL_recv`
- `wolfSSL_read`
- `wolfSSL_peek`

Return: int This function returns the number of bytes pending.

Example

```
int pending = 0;
WOLFSSL* ssl = 0;
...

pending = wolfSSL_pending(ssl);
printf("There are %d bytes buffered and available for reading", pending);
```

17.5.2.20 function `wolfSSL_save_session_cache`

```
WOLFSSL_API int wolfSSL_save_session_cache(
    const char *
)
```

This function persists the session cache to file. It doesn't use memsave because of additional memory use.

Parameters:

- **name** is a constant char pointer that points to a file for writing.

See:

- XFWRITE
- [wolfSSL_restore_session_cache](#)
- [wolfSSL_memrestore_session_cache](#)

Return:

- SSL_SUCCESS returned if the function executed without error. The session cache has been written to a file.
- SSL_BAD_FILE returned if fname cannot be opened or is otherwise corrupt.
- FWRITE_ERROR returned if XFWRITE failed to write to the file.
- BAD_MUTEX_E returned if there was a mutex lock failure.

Example

```
const char* fname;
...
if(wolfSSL_save_session_cache(fname) != SSL_SUCCESS){
    // Fail to write to file.
}
```

17.5.2.21 function `wolfSSL_restore_session_cache`

```
WOLFSSL_API int wolfSSL_restore_session_cache(
    const char *
```

)

This function restores the persistent session cache from file. It does not use memstore because of additional memory use.

Parameters:

- **fname** a constant char pointer file input that will be read.

See:

- XFREAD
- XFOPEN

Return:

- SSL_SUCCESS returned if the function executed without error.
- SSL_BAD_FILE returned if the file passed into the function was corrupted and could not be opened by XFOPEN.
- FREAD_ERROR returned if the file had a read error from XFREAD.
- CACHE_MATCH_ERROR returned if the session cache header match failed.
- BAD_MUTEX_E returned if there was a mutex lock failure.

Example

```
const char *fname;
...
if(wolfSSL_restore_session_cache(fname) != SSL_SUCCESS){
    // Failure case. The function did not return SSL_SUCCESS.
}
```

17.5.2.22 function `wolfSSL_memsave_session_cache`

```
WOLFSSL_API int wolfSSL_memsave_session_cache(
    void * ,
```

```
    int
)
```

This function persists session cache to memory.

Parameters:

- **mem** a void pointer representing the destination for the memory copy, XMEMCPY().
- **sz** an int type representing the size of mem.

See:

- XMEMCPY
- [wolfSSL_get_session_cache_memsize](#)

Return:

- SSL_SUCCESS returned if the function executed without error. The session cache has been successfully persisted to memory.
- BAD_MUTEX_E returned if there was a mutex lock error.
- BUFFER_E returned if the buffer size was too small.

Example

```
void* mem;
int sz; // Max size of the memory buffer.
...
if(wolfSSL_memsave_session_cache(mem, sz) != SSL_SUCCESS){
    // Failure case, you did not persist the session cache to memory
}
```

17.5.2.23 function wolfSSL_memrestore_session_cache

```
WOLFSSL_API int wolfSSL_memrestore_session_cache(
    const void * ,
    int
)
```

This function restores the persistent session cache from memory.

Parameters:

- **mem** a constant void pointer containing the source of the restoration.
- **sz** an integer representing the size of the memory buffer.

See: [wolfSSL_save_session_cache](#)

Return:

- SSL_SUCCESS returned if the function executed without an error.
- BUFFER_E returned if the memory buffer is too small.
- BAD_MUTEX_E returned if the session cache mutex lock failed.
- CACHE_MATCH_ERROR returned if the session cache header match failed.

Example

```
const void* memoryFile;
int szMf;
...
if(wolfSSL_memrestore_session_cache(memoryFile, szMf) != SSL_SUCCESS){
    // Failure case. SSL_SUCCESS was not returned.
}
```

17.5.2.24 function wolfSSL_get_session_cache_memsize

```
WOLFSSL_API int wolfSSL_get_session_cache_memsize(
    void
)
```

This function returns how large the session cache save buffer should be.

Parameters:

- **none** No parameters.

See: [wolfSSL_memrestore_session_cache](#)

Return: int This function returns an integer that represents the size of the session cache save buffer.

Example

```
int sz = // Minimum size for error checking;
...
if(sz < wolfSSL_get_session_cache_memsize()){
    // Memory buffer is too small
}
```

17.5.2.25 function wolfSSL_session_reused

```
WOLFSSL_API int wolfSSL_session_reused(
    WOLFSSL *
)
```

This function returns the resuming member of the options struct. The flag indicates whether or not to reuse a session. If not, a new session must be established.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using [wolfSSL_new\(\)](#).

See:

- [wolfSSL_SESSION_free](#)
- [wolfSSL_GetSessionIndex](#)
- [wolfSSL_memsave_session_cache](#)

Return: This function returns an int type held in the Options structure representing the flag for session reuse.

Example

```
WOLFSSL* ssl = wolfSSL_new(ctx);
...
if(!wolfSSL_session_reused(sslResume)){
    // No session reuse allowed.
}
```

17.5.2.26 function wolfSSL_get_version

```
WOLFSSL_API const char * wolfSSL_get_version(
    WOLFSSL *
)
```

Returns the SSL version being used as a string.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using `wolfSSL_new()`.

See: `wolfSSL_lib_version`

Return:

- "SSLv3" Using SSLv3
- "TLSv1" Using TLSv1
- "TLSv1.1" Using TLSv1.1
- "TLSv1.2" Using TLSv1.2
- "TLSv1.3" Using TLSv1.3
- "DTLS": Using DTLS
- "DTLSv1.2" Using DTLSv1.2
- "unknown" There was a problem determining which version of TLS being used.

Example

```
wolfSSL_Init();
WOLFSSL_CTX* ctx;
WOLFSSL* ssl;
WOLFSSL_METHOD method = // Some wolfSSL method
ctx = wolfSSL_CTX_new(method);
ssl = wolfSSL_new(ctx);
printf(wolfSSL_get_version("Using version: %s", ssl));
```

17.5.2.27 function `wolfSSL_get_current_cipher_suite`

```
WOLFSSL_API int wolfSSL_get_current_cipher_suite(
    WOLFSSL * ssl
)
```

Returns the current cipher suit an ssl session is using.

Parameters:

- **ssl** The SSL session to check.

See:

- `wolfSSL_CIPHER_get_name`
- `wolfSSL_get_current_cipher`
- `wolfSSL_get_cipher_list`

Return:

- `ssl->options.cipherSuite` An integer representing the current cipher suite.
- 0 The ssl session provided is null.

Example

```
wolfSSL_Init();
WOLFSSL_CTX* ctx;
WOLFSSL* ssl;
WOLFSSL_METHOD method = // Some wolfSSL method
ctx = wolfSSL_CTX_new(method);
ssl = wolfSSL_new(ctx);

if(wolfSSL_get_current_cipher_suite(ssl) == 0)
{
    // Error getting cipher suite
}
```

17.5.2.28 function wolfSSL_get_current_cipher

```
WOLFSSL_API WOLFSSL_CIPHER * wolfSSL_get_current_cipher(  
    WOLFSSL *  
)
```

This function returns a pointer to the current cipher in the ssl session.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using [wolfSSL_new\(\)](#).

See:

- [wolfSSL_get_cipher](#)
- [wolfSSL_get_cipher_name_internal](#)
- [wolfSSL_get_cipher_name](#)

Return:

- The function returns the address of the cipher member of the WOLFSSL struct. This is a pointer to the WOLFSSL_CIPHER structure.
- NULL returned if the WOLFSSL structure is NULL.

Example

```
WOLFSSL_CTX* ctx = wolfSSL_CTX_new( protocol method );  
WOLFSSL* ssl = wolfSSL_new(ctx);  
...  
WOLFSSL_CIPHER* cipherCurr = wolfSSL_get_current_cipher;  
  
if(!cipherCurr){  
    // Failure case.  
} else {  
    // The cipher was returned to cipherCurr  
}
```

17.5.2.29 function wolfSSL_CIPHER_get_name

```
WOLFSSL_API const char * wolfSSL_CIPHER_get_name(  
    const WOLFSSL_CIPHER * cipher  
)
```

This function matches the cipher suite in the SSL object with the available suites and returns the string representation.

Parameters:

- **cipher** a constant pointer to a WOLFSSL_CIPHER structure.

See:

- [wolfSSL_get_cipher](#)
- [wolfSSL_get_current_cipher](#)
- [wolfSSL_get_cipher_name_internal](#)
- [wolfSSL_get_cipher_name](#)

Return:

- string This function returns the string representation of the matched cipher suite.
- none It will return "None" if there are no suites matched.

Example

```
// gets cipher name in the format DHE_RSA ...
const char* wolfSSL_get_cipher_name_internal(WOLFSSL* ssl){
WOLFSSL_CIPHER* cipher;
const char* fullName;
...
cipher = wolfSSL_get_curent_cipher(ssl);
fullName = wolfSSL_CIPHER_get_name(cipher);

if(fullName){
    // sanity check on returned cipher
}
```

17.5.2.30 function wolfSSL_get_cipher

```
WOLFSSL_API const char * wolfSSL_get_cipher(
    WOLFSSL *
)
```

This function matches the cipher suite in the SSL object with the available suites.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using [wolfSSL_new\(\)](#).

See:

- [wolfSSL_CIPHER_get_name](#)
- [wolfSSL_get_current_cipher](#)

Return: This function returns the string value of the suite matched. It will return “None” if there are no suites matched.

Example

```
#ifdef WOLFSSL_DTLS
...
// make sure a valid suite is used
if(wolfSSL_get_cipher(ssl) == NULL){
    WOLFSSL_MSG("Can not match cipher suite imported");
    return MATCH_SUITE_ERROR;
}
...
#endif // WOLFSSL_DTLS
```

17.5.2.31 function wolfSSL_BIO_get_mem_data

```
WOLFSSL_API int wolfSSL_BIO_get_mem_data(
    WOLFSSL_BIO * bio,
    void * p
)
```

This is used to set a byte pointer to the start of the internal memory buffer.

Parameters:

- **bio** WOLFSSL_BIO structure to get memory buffer of.
- **p** byte pointer to set to memory buffer.

See:

- [wolfSSL_BIO_new](#)

- wolfSSL_BIO_s_mem
- wolfSSL_BIO_set_fp
- wolfSSL_BIO_free

Return:

- size On success the size of the buffer is returned
- SSL_FATAL_ERROR If an error case was encountered.

Example

```
WOLFSSL_BIO* bio;
const byte* p;
int ret;
bio = wolfSSL_BIO_new(wolfSSL_BIO_s_mem());
ret = wolfSSL_BIO_get_mem_data(bio, &p);
// check ret value
```

17.5.2.32 function wolfSSL_BIO_set_fd

```
WOLFSSL_API long wolfSSL_BIO_set_fd(
    WOLFSSL_BIO * b,
    int fd,
    int flag
)
```

Sets the file descriptor for bio to use.

Parameters:

- **bio** WOLFSSL_BIO structure to set fd.
- **fd** file descriptor to use.
- **closeF** flag for behavior when closing fd.

See:

- wolfSSL_BIO_new
- wolfSSL_BIO_free

Return: SSL_SUCCESS(1) upon success.

Example

```
WOLFSSL_BIO* bio;
int fd;
// setup bio
wolfSSL_BIO_set_fd(bio, fd, BIO_NOCLOSE);
```

17.5.2.33 function wolfSSL_BIO_set_close

```
WOLFSSL_API int wolfSSL_BIO_set_close(
    WOLFSSL_BIO * b,
    long flag
)
```

Sets the close flag, used to indicate that the i/o stream should be closed when the BIO is freed.

Parameters:

- **bio** WOLFSSL_BIO structure.
- **flag** flag for behavior when closing i/o stream.

See:

- wolfSSL_BIO_new
- wolfSSL_BIO_free

Return: SSL_SUCCESS(1) upon success.

Example

```
WOLFSSL_BIO* bio;  
// setup bio  
wolfSSL_BIO_set_close(bio, BIO_NOCLOSE);
```

17.5.2.34 function wolfSSL_BIO_s_socket

```
WOLFSSL_API WOLFSSL_BIO_METHOD * wolfSSL_BIO_s_socket(  
    void  
)
```

This is used to get a BIO_SOCKET type WOLFSSL_BIO_METHOD.

Parameters:

- **none** No parameters.

See:

- wolfSSL_BIO_new
- wolfSSL_BIO_s_mem

Return: WOLFSSL_BIO_METHOD pointer to a WOLFSSL_BIO_METHOD structure that is a socket type

Example

```
WOLFSSL_BIO* bio;  
bio = wolfSSL_BIO_new(wolfSSL_BIO_s_socket);
```

17.5.2.35 function wolfSSL_BIO_set_write_buf_size

```
WOLFSSL_API int wolfSSL_BIO_set_write_buf_size(  
    WOLFSSL_BIO * b,  
    long size  
)
```

This is used to set the size of write buffer for a WOLFSSL_BIO. If write buffer has been previously set this function will free it when resetting the size. It is similar to wolfSSL_BIO_reset in that it resets read and write indexes to 0.

Parameters:

- **bio** WOLFSSL_BIO structure to set fd.
- **size** size of buffer to allocate.

See:

- wolfSSL_BIO_new
- wolfSSL_BIO_s_mem
- wolfSSL_BIO_free

Return:

- SSL_SUCCESS On successfully setting the write buffer.
- SSL_FAILURE If an error case was encountered.

Example

```
WOLFSSL_BIO* bio;
int ret;
bio = wolfSSL_BIO_new(wolfSSL_BIO_s_mem());
ret = wolfSSL_BIO_set_write_buf_size(bio, 15000);
// check return value
```

17.5.2.36 function wolfSSL_BIO_make_bio_pair

```
WOLFSSL_API int wolfSSL_BIO_make_bio_pair(
    WOLFSSL_BIO * b1,
    WOLFSSL_BIO * b2
)
```

This is used to pair two bios together. A pair of bios acts similar to a two way pipe writing to one can be read by the other and vice versa. It is expected that both bios be in the same thread, this function is not thread safe. Freeing one of the two bios removes both from being paired. If a write buffer size was not previously set for either of the bios it is set to a default size of 17000 (WOLFSSL_BIO_SIZE) before being paired.

Parameters:

- **b1** WOLFSSL_BIO structure to set pair.
- **b2** second WOLFSSL_BIO structure to complete pair.

See:

- wolfSSL_BIO_new
- wolfSSL_BIO_s_mem
- wolfSSL_BIO_free

Return:

- SSL_SUCCESS On successfully pairing the two bios.
- SSL_FAILURE If an error case was encountered.

Example

```
WOLFSSL_BIO* bio;
WOLFSSL_BIO* bio2;
int ret;
bio = wolfSSL_BIO_new(wolfSSL_BIO_s_bio());
bio2 = wolfSSL_BIO_new(wolfSSL_BIO_s_bio());
ret = wolfSSL_BIO_make_bio_pair(bio, bio2);
// check ret value
```

17.5.2.37 function wolfSSL_BIO_ctrl_reset_read_request

```
WOLFSSL_API int wolfSSL_BIO_ctrl_reset_read_request(
    WOLFSSL_BIO * b
)
```

This is used to set the read request flag back to 0.

Parameters:

- **bio** WOLFSSL_BIO structure to set read request flag.

See:

- wolfSSL_BIO_new, wolfSSL_BIO_s_mem

- wolfSSL_BIO_new, wolfSSL_BIO_free

Return:

- SSL_SUCCESS On successfully setting value.
- SSL_FAILURE If an error case was encountered.

Example

```
WOLFSSL_BIO* bio;
int ret;
...
ret = wolfSSL_BIO_ctrl_reset_read_request(bio);
// check ret value
```

17.5.2.38 function wolfSSL_BIO_nread0

```
WOLFSSL_API int wolfSSL_BIO_nread0(
    WOLFSSL_BIO * bio,
    char ** buf
)
```

This is used to get a buffer pointer for reading from. Unlike wolfSSL_BIO_nread the internal read index is not advanced by the number returned from the function call. Reading past the value returned can result in reading out of array bounds.

Parameters:

- **bio** WOLFSSL_BIO structure to read from.
- **buf** pointer to set at beginning of read array.

See:

- wolfSSL_BIO_new
- wolfSSL_BIO_nwrite0

Return: >=0 on success return the number of bytes to read

Example

```
WOLFSSL_BIO* bio;
char* bufPt;
int ret;
// set up bio
ret = wolfSSL_BIO_nread0(bio, &bufPt); // read as many bytes as possible
// handle negative ret check
// read ret bytes from bufPt
```

17.5.2.39 function wolfSSL_BIO_nread

```
WOLFSSL_API int wolfSSL_BIO_nread(
    WOLFSSL_BIO * bio,
    char ** buf,
    int num
)
```

This is used to get a buffer pointer for reading from. The internal read index is advanced by the number returned from the function call with buf being pointed to the beginning of the buffer to read from. In the case that less bytes are in the read buffer than the value requested with num the lesser value is returned. Reading past the value returned can result in reading out of array bounds.

Parameters:

- **bio** WOLFSSL_BIO structure to read from.
- **buf** pointer to set at beginning of read array.
- **num** number of bytes to try and read.

See:

- wolfSSL_BIO_new
- wolfSSL_BIO_nwrite

Return:

- =0 on success return the number of bytes to read
- WOLFSSL_BIO_ERROR(-1) on error case with nothing to read return -1

Example

```
WOLFSSL_BIO* bio;
char* bufPt;
int ret;

// set up bio
ret = wolfSSL_BIO_nread(bio, &bufPt, 10); // try to read 10 bytes
// handle negative ret check
// read ret bytes from bufPt
```

17.5.2.40 function wolfSSL_BIO_nwrite

```
WOLFSSL_API int wolfSSL_BIO_nwrite(
    WOLFSSL_BIO * bio,
    char ** buf,
    int num
)
```

Gets a pointer to the buffer for writing as many bytes as returned by the function. Writing more bytes to the pointer returned then the value returned can result in writing out of bounds.

Parameters:

- **bio** WOLFSSL_BIO structure to write to.
- **buf** pointer to buffer to write to.
- **num** number of bytes desired to be written.

See:

- wolfSSL_BIO_new
- wolfSSL_BIO_free
- wolfSSL_BIO_nread

Return:

- int Returns the number of bytes that can be written to the buffer pointer returned.
- WOLFSSL_BIO_UNSET(-2) in the case that is not part of a bio pair
- WOLFSSL_BIO_ERROR(-1) in the case that there is no more room to write to

Example

```
WOLFSSL_BIO* bio;
char* bufPt;
int ret;
// set up bio
```

```
ret = wolfSSL_BIO_nwrite(bio, &bufPt, 10); // try to write 10 bytes
// handle negative ret check
// write ret bytes to bufPt
```

17.5.2.41 function `wolfSSL_BIO_reset`

```
WOLFSSL_API int wolfSSL_BIO_reset(
    WOLFSSL_BIO * bio
)
```

Resets bio to an initial state. As an example for type `BIO_BIO` this resets the read and write index.

Parameters:

- **bio** WOLFSSL_BIO structure to reset.

See:

- `wolfSSL_BIO_new`
- `wolfSSL_BIO_free`

Return:

- 0 On successfully resetting the bio.
- WOLFSSL_BIO_ERROR(-1) Returned on bad input or unsuccessful reset.

Example

```
WOLFSSL_BIO* bio;
// setup bio
wolfSSL_BIO_reset(bio);
//use pt
```

17.5.2.42 function `wolfSSL_BIO_seek`

```
WOLFSSL_API int wolfSSL_BIO_seek(
    WOLFSSL_BIO * bio,
    int ofs
)
```

This function adjusts the file pointer to the offset given. This is the offset from the head of the file.

Parameters:

- **bio** WOLFSSL_BIO structure to set.
- **ofs** offset into file.

See:

- `wolfSSL_BIO_new`
- `wolfSSL_BIO_s_mem`
- `wolfSSL_BIO_set_fp`
- `wolfSSL_BIO_free`

Return:

- 0 On successfully seeking.
- -1 If an error case was encountered.

Example

```

WOLFSSL_BIO* bio;
XFILE fp;
int ret;
bio = wolfSSL_BIO_new(wolfSSL_BIO_s_file());
ret = wolfSSL_BIO_set_fp(bio, &fp);
// check ret value
ret = wolfSSL_BIO_seek(bio, 3);
// check ret value

```

17.5.2.43 function wolfSSL_BIO_write_filename

```

WOLFSSL_API int wolfSSL_BIO_write_filename(
    WOLFSSL_BIO * bio,
    char * name
)

```

This is used to set and write to a file. Will overwrite any data currently in the file and is set to close the file when the bio is freed.

Parameters:

- **bio** WOLFSSL_BIO structure to set file.
- **name** name of file to write to.

See:

- wolfSSL_BIO_new
- wolfSSL_BIO_s_file
- **wolfSSL_BIO_set_fp**
- wolfSSL_BIO_free

Return:

- SSL_SUCCESS On successfully opening and setting file.
- SSL_FAILURE If an error case was encountered.

Example

```

WOLFSSL_BIO* bio;
int ret;
bio = wolfSSL_BIO_new(wolfSSL_BIO_s_file());
ret = wolfSSL_BIO_write_filename(bio, "test.txt");
// check ret value

```

17.5.2.44 function wolfSSL_BIO_set_mem_eof_return

```

WOLFSSL_API long wolfSSL_BIO_set_mem_eof_return(
    WOLFSSL_BIO * bio,
    int v
)

```

This is used to set the end of file value. Common value is -1 so as not to get confused with expected positive values.

Parameters:

- **bio** WOLFSSL_BIO structure to set end of file value.
- **v** value to set in bio.

See:

- wolfSSL_BIO_new
- wolfSSL_BIO_s_mem
- **wolfSSL_BIO_set_fp**
- wolfSSL_BIO_free

Return: 0 returned on completion

Example

```
WOLFSSL_BIO* bio;
int ret;
bio = wolfSSL_BIO_new(wolfSSL_BIO_s_mem());
ret = wolfSSL_BIO_set_mem_eof_return(bio, -1);
// check ret value
```

17.5.2.45 function wolfSSL_BIO_get_mem_ptr

```
WOLFSSL_API long wolfSSL_BIO_get_mem_ptr(
    WOLFSSL_BIO * bio,
    WOLFSSL_BUF_MEM ** m
)
```

This is a getter function for WOLFSSL_BIO memory pointer.

Parameters:

- **bio** pointer to the WOLFSSL_BIO structure for getting memory pointer.
- **ptr** structure that is currently a char*. Is set to point to bio's memory.

See:

- wolfSSL_BIO_new
- wolfSSL_BIO_s_mem

Return:

- SSL_SUCCESS On successfully getting the pointer SSL_SUCCESS is returned (currently value of 1).
- SSL_FAILURE Returned if NULL arguments are passed in (currently value of 0).

Example

```
WOLFSSL_BIO* bio;
WOLFSSL_BUF_MEM* pt;
// setup bio
wolfSSL_BIO_get_mem_ptr(bio, &pt);
//use pt
```

17.5.2.46 function wolfSSL_lib_version

```
WOLFSSL_API const char * wolfSSL_lib_version(
    void
)
```

This function returns the current library version.

Parameters:

- **none** No parameters.

See: word32_wolfSSL_lib_version_hex

Return: LIBWOLFSSL_VERSION_STRING a const char pointer defining the version.

Example

```
char version[MAXSIZE];
version = wolfSSL_KeepArrays();
...
if(version != ExpectedVersion){
    // Handle the mismatch case
}
```

17.5.2.47 function wolfSSL_lib_version_hex

```
WOLFSSL_API word32 wolfSSL_lib_version_hex(
    void
)
```

This function returns the current library version in hexadecimal notation.

Parameters:

- **none** No parameters.

See: [wolfSSL_lib_version](#)

Return: LILBWOLFSSL_VERSION_HEX returns the hexadecimal version defined in wolfssl/version.h.

Example

```
word32 libV;
libV = wolfSSL_lib_version_hex();

if(libV != EXPECTED_HEX){
    // How to handle an unexpected value
} else {
    // The expected result for libV
}
```

17.5.2.48 function wolfSSL_negotiate

```
WOLFSSL_API int wolfSSL_negotiate(
    WOLFSSL * ssl
)
```

Performs the actual connect or accept based on the side of the SSL method. If called from the client side then an `wolfSSL_connect()` is done while a `wolfSSL_accept()` is performed if called from the server side.

Parameters:

- **ssl** pointer to the SSL session, created with [wolfSSL_new\(\)](#).

See:

- `SSL_connect`
- `SSL_accept`

Return:

- `SSL_SUCCESS` will be returned if successful. (Note, older versions will return 0.)
- `SSL_FATAL_ERROR` will be returned if the underlying call resulted in an error. Use [wolfSSL_get_error\(\)](#) to get a specific error code.

Example

```

int ret = SSL_FATAL_ERROR;
WOLFSSL* ssl = 0;
...
ret = wolfSSL_negotiate(ssl);
if (ret == SSL_FATAL_ERROR) {
    // SSL establishment failed
int error_code = wolfSSL_get_error(ssl);
...
}
...

```

17.5.2.49 function `wolfSSL_connect_cert`

```

WOLFSSL_API int wolfSSL_connect_cert(
    WOLFSSL * ssl
)

```

This function is called on the client side and initiates an SSL/TLS handshake with a server only long enough to get the peer's certificate chain. When this function is called, the underlying communication channel has already been set up. `wolfSSL_connect_cert()` works with both blocking and non-blocking I/O. When the underlying I/O is non-blocking, `wolfSSL_connect_cert()` will return when the underlying I/O could not satisfy the needs of `wolfSSL_connect_cert()` to continue the handshake. In this case, a call to `wolfSSL_get_error()` will yield either `SSL_ERROR_WANT_READ` or `SSL_ERROR_WANT_WRITE`. The calling process must then repeat the call to `wolfSSL_connect_cert()` when the underlying I/O is ready and `wolfSSL` will pick up where it left off. When using a non-blocking socket, nothing needs to be done, but `select()` can be used to check for the required condition. If the underlying I/O is blocking, `wolfSSL_connect_cert()` will only return once the peer's certificate chain has been received.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using `wolfSSL_new()`.

See:

- `wolfSSL_get_error`
- `wolfSSL_connect`
- `wolfSSL_accept`

Return:

- `SSL_SUCCESS` upon success.
- `SSL_FAILURE` will be returned if the SSL session parameter is NULL.
- `SSL_FATAL_ERROR` will be returned if an error occurred. To get a more detailed error code, call `wolfSSL_get_error()`.

Example

```

int ret = 0;
int err = 0;
WOLFSSL* ssl;
char buffer[80];
...
ret = wolfSSL_connect_cert(ssl);
if (ret != SSL_SUCCESS) {
    err = wolfSSL_get_error(ssl, ret);
    printf("error = %d, %s\n", err, wolfSSL_ERR_error_string(err, buffer));
}

```

17.5.2.50 function `wolfSSL_writev`

```
WOLFSSL_API int wolfSSL_writev(  
    WOLFSSL * ssl,  
    const struct iovec * iov,  
    int iovcnt  
)
```

Simulates writev semantics but doesn't actually do block at a time because of `SSL_write()` behavior and because front adds may be small. Makes porting into software that uses writev easier.

Parameters:

- **ssl** pointer to the SSL session, created with `wolfSSL_new()`.
- **iov** array of I/O vectors to write
- **iovcnt** number of vectors in iov array.

See: `wolfSSL_write`

Return:

- 0 the number of bytes written upon success.
- 0 will be returned upon failure. Call `wolfSSL_get_error()` for the specific error code.
- `MEMORY_ERROR` will be returned if a memory error was encountered.
- `SSL_FATAL_ERROR` will be returned upon failure when either an error occurred or, when using non-blocking sockets, the `SSL_ERROR_WANT_READ` or `SSL_ERROR_WANT_WRITE` error was received and the application needs to call `wolfSSL_write()` to get a specific error code.

Example

```
WOLFSSL* ssl = 0;  
char *bufA = "hello\n";  
char *bufB = "hello world\n";  
int iovcnt;  
struct iovec iov[2];  
  
iov[0].iov_base = buffA;  
iov[0].iov_len = strlen(buffA);  
iov[1].iov_base = buffB;  
iov[1].iov_len = strlen(buffB);  
iovcnt = 2;  
...  
ret = wolfSSL_writev(ssl, iov, iovcnt);  
// wrote "ret" bytes, or error if <= 0.
```

17.5.2.51 function `wolfSSL_SNI_Status`

```
WOLFSSL_API unsigned char wolfSSL_SNI_Status(  
    WOLFSSL * ssl,  
    unsigned char type  
)
```

This function gets the status of an SNI object.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using `wolfSSL_new()`.
- **type** the SNI type.

See:

- TLSX_SNI_Status
- TLSX_SNI_find
- TLSX_Find

Return:

- value This function returns the byte value of the SNI struct's status member if the SNI is not NULL.
- 0 if the SNI object is NULL.

Example

```
WOLFSSL_CTX* ctx = wolfSSL_CTX_new( protocol method );
WOLFSSL* ssl = wolfSSL_new(ctx);
...
#define AssertIntEQ(x, y) AssertInt(x, y, ==, !=)
...
Byte type = WOLFSSL_SNI_HOST_NAME;
char* request = (char*)&type;
AssertIntEQ(WOLFSSL_SNI_NO_MATCH, wolfSSL_SNI_Status(ssl, type));
...
```

17.5.2.52 function wolfSSL_UseSecureRenegotiation

```
WOLFSSL_API int wolfSSL_UseSecureRenegotiation(
    WOLFSSL * ssl
)
```

This function forces secure renegotiation for the supplied WOLFSSL structure. This is not recommended.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using `wolfSSL_new()`.

See:

- TLSX_Find
- TLSX_UseSecureRenegotiation

Return:

- SSL_SUCCESS Successfully set secure renegotiation.
- BAD_FUNC_ARG Returns error if ssl is null.
- MEMORY_E Returns error if unable to allocate memory for secure renegotiation.

Example

```
wolfSSL_Init();
WOLFSSL_CTX* ctx;
WOLFSSL* ssl;
WOLFSSL_METHOD method = // Some wolfSSL method
ctx = wolfSSL_CTX_new(method);
ssl = wolfSSL_new(ctx);

if(wolfSSL_UseSecureRenegotiation(ssl) != SSL_SUCCESS)
{
    // Error setting secure renegotiation
}
```

17.5.2.53 function wolfSSL_Rehandshake

```
WOLFSSL_API int wolfSSL_Rehandshake(  
    WOLFSSL * ssl  
)
```

This function executes a secure renegotiation handshake; this is user forced as wolfSSL discourages this functionality.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using [wolfSSL_new\(\)](#).

See:

- [wolfSSL_negotiate](#)
- [wc_InitSha512](#)
- [wc_InitSha384](#)
- [wc_InitSha256](#)
- [wc_InitSha](#)
- [wc_InitMd5](#)

Return:

- SSL_SUCCESS returned if the function executed without error.
- BAD_FUNC_ARG returned if the WOLFSSL structure was NULL or otherwise if an unacceptable argument was passed in a subroutine.
- SECURE_RENEGOTIATION_E returned if there was an error with renegotiating the handshake.
- SSL_FATAL_ERROR returned if there was an error with the server or client configuration and the renegotiation could not be completed. See [wolfSSL_negotiate\(\)](#).

Example

```
WOLFSSL* ssl = wolfSSL_new(ctx);  
...  
if(wolfSSL_Rehandshake(ssl) != SSL_SUCCESS){  
    // There was an error and the rehandshake is not successful.  
}
```

17.5.2.54 function wolfSSL_UseSessionTicket

```
WOLFSSL_API int wolfSSL_UseSessionTicket(  
    WOLFSSL * ssl  
)
```

Force provided WOLFSSL structure to use session ticket. The constant HAVE_SESSION_TICKET should be defined and the constant NO_WOLFSSL_CLIENT should not be defined to use this function.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using [wolfSSL_new\(\)](#).

See: TLSX_UseSessionTicket

Return:

- SSL_SUCCESS Successfully set use session ticket.
- BAD_FUNC_ARG Returned if ssl is null.
- MEMORY_E Error allocating memory for setting session ticket.

Example

```

wolfSSL_Init();
WOLFSSL_CTX* ctx;
WOLFSSL* ssl;
WOLFSSL_METHOD method = // Some wolfSSL method
ctx = wolfSSL_CTX_new(method);
ssl = wolfSSL_new(ctx);

if(wolfSSL_UseSessionTicket(ssl) != SSL_SUCCESS)
{
    // Error setting session ticket
}

```

17.5.2.55 function wolfSSL_get_SessionTicket

```

WOLFSSL_API int wolfSSL_get_SessionTicket(
    WOLFSSL * ,
    unsigned char * ,
    word32 *
)

```

This function copies the ticket member of the Session structure to the buffer.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using [wolfSSL_new\(\)](#).
- **buf** a byte pointer representing the memory buffer.
- **bufSz** a word32 pointer representing the buffer size.

See:

- [wolfSSL_UseSessionTicket](#)
- [wolfSSL_set_SessionTicket](#)

Return:

- SSL_SUCCESS returned if the function executed without error.
- BAD_FUNC_ARG returned if one of the arguments was NULL or if the bufSz argument was 0.

Example

```

WOLFSSL_CTX* ctx = wolfSSL_CTX_new( protocol method );
WOLFSSL* ssl = wolfSSL_new(ctx);
byte* buf;
word32 bufSz; // Initialize with buf size
...
if(wolfSSL_get_SessionTicket(ssl, buf, bufSz) <= 0){
    // Nothing was written to the buffer
} else {
    // the buffer holds the content from ssl->session.ticket
}

```

17.5.2.56 function wolfSSL_set_SessionTicket

```

WOLFSSL_API int wolfSSL_set_SessionTicket(
    WOLFSSL * ,
    const unsigned char * ,
    word32
)

```

This function sets the ticket member of the WOLFSSL_SESSION structure within the WOLFSSL struct. The buffer passed into the function is copied to memory.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using [wolfSSL_new\(\)](#).
- **buf** a byte pointer that gets loaded into the ticket member of the session structure.
- **bufSz** a word32 type that represents the size of the buffer.

See: [wolfSSL_set_SessionTicket_cb](#)

Return:

- SSL_SUCCESS returned on successful execution of the function. The function returned without errors.
- BAD_FUNC_ARG returned if the WOLFSSL structure is NULL. This will also be thrown if the buf argument is NULL but the bufSz argument is not zero.

Example

```
WOLFSSL_CTX* ctx = wolfSSL_CTX_new( protocol method );
WOLFSSL* ssl = wolfSSL_new(ctx);
byte* buffer; // File to load
word32 bufSz;
...
if(wolfSSL_KeepArrays(ssl, buffer, bufSz) != SSL_SUCCESS){
    // There was an error loading the buffer to memory.
}
```

17.5.2.57 function wolfSSL_PrintSessionStats

```
WOLFSSL_API int wolfSSL_PrintSessionStats(
    void
)
```

This function prints the statistics from the session.

Parameters:

- **none** No parameters.

See: [wolfSSL_get_session_stats](#)

Return:

- SSL_SUCCESS returned if the function and subroutines return without error. The session stats have been successfully retrieved and printed.
- BAD_FUNC_ARG returned if the subroutine [wolfSSL_get_session_stats\(\)](#) was passed an unacceptable argument.
- BAD_MUTEX_E returned if there was a mutex error in the subroutine.

Example

```
// You will need to have a session object to retrieve stats from.
if(wolfSSL_PrintSessionStats(void) != SSL_SUCCESS ){
    // Did not print session stats
}
```

17.5.2.58 function wolfSSL_get_session_stats

```
WOLFSSL_API int wolfSSL_get_session_stats(
    unsigned int * active,
    unsigned int * total,
    unsigned int * peak,
    unsigned int * maxSessions
)
```

This function gets the statistics for the session.

Parameters:

- **active** a word32 pointer representing the total current sessions.
- **total** a word32 pointer representing the total sessions.
- **peak** a word32 pointer representing the peak sessions.
- **maxSessions** a word32 pointer representing the maximum sessions.

See: [wolfSSL_PrintSessionStats](#)

Return:

- SSL_SUCCESS returned if the function and subroutines return without error. The session stats have been successfully retrieved and printed.
- BAD_FUNC_ARG returned if the subroutine [wolfSSL_get_session_stats\(\)](#) was passed an unacceptable argument.
- BAD_MUTEX_E returned if there was a mutex error in the subroutine.

Example

```
int wolfSSL_PrintSessionStats(void){
...
ret = wolfSSL_get_session_stats(&totalSessionsNow,
&totalSessionsSeen, &peak, &maxSessions);
...
return ret;
```

17.5.2.59 function wolfSSL_BIO_set_fp

```
WOLFSSL_API long wolfSSL_BIO_set_fp(
    WOLFSSL_BIO * bio,
    XFILE fp,
    int c
)
```

This is used to set the internal file pointer for a BIO.

Parameters:

- **bio** WOLFSSL_BIO structure to set pair.
- **fp** file pointer to set in bio.
- **c** close file behavior flag.

See:

- wolfSSL_BIO_new
- wolfSSL_BIO_s_mem
- [wolfSSL_BIO_get_fp](#)
- wolfSSL_BIO_free

Return:

- SSL_SUCCESS On successfully setting file pointer.
- SSL_FAILURE If an error case was encountered.

Example

```
WOLFSSL_BIO* bio;
XFILE fp;
int ret;
bio = wolfSSL_BIO_new(wolfSSL_BIO_s_file());
ret = wolfSSL_BIO_set_fp(bio, fp, BIO_CLOSE);
// check ret value
```

17.5.2.60 function `wolfSSL_BIO_get_fp`

```
WOLFSSL_API long wolfSSL_BIO_get_fp(
    WOLFSSL_BIO * bio,
    XFILE * fp
)
```

This is used to get the internal file pointer for a BIO.

Parameters:

- **bio** WOLFSSL_BIO structure to set pair.
- **fp** file pointer to set in bio.

See:

- `wolfSSL_BIO_new`
- `wolfSSL_BIO_s_mem`
- `wolfSSL_BIO_set_fp`
- `wolfSSL_BIO_free`

Return:

- `SSL_SUCCESS` On successfully getting file pointer.
- `SSL_FAILURE` If an error case was encountered.

Example

```
WOLFSSL_BIO* bio;
XFILE fp;
int ret;
bio = wolfSSL_BIO_new(wolfSSL_BIO_s_file());
ret = wolfSSL_BIO_get_fp(bio, &fp);
// check ret value
```

17.5.2.61 function `wolfSSL_BIO_ctrl_pending`

```
WOLFSSL_API size_t wolfSSL_BIO_ctrl_pending(
    WOLFSSL_BIO * b
)
```

Gets the number of pending bytes to read. If BIO type is `BIO_BIO` then is the number to read from pair. If BIO contains an SSL object then is pending data from SSL object (`wolfSSL_pending(ssl)`). If is `BIO_MEMORY` type then returns the size of memory buffer.

Parameters:

- **bio** pointer to the WOLFSSL_BIO structure that has already been created.

See:

- `wolfSSL_BIO_make_bio_pair`
- `wolfSSL_BIO_new`

Return: >=0 number of pending bytes.

Example

```
WOLFSSL_BIO* bio;
int pending;
bio = wolfSSL_BIO_new();
...
pending = wolfSSL_BIO_ctrl_pending(bio);
```

17.5.2.62 function wolfSSL_set_jobject

```
WOLFSSL_API int wolfSSL_set_jobject(
    WOLFSSL * ssl,
    void * objPtr
)
```

This function sets the jobjectRef member of the WOLFSSL structure.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using [wolfSSL_new\(\)](#).
- **objPtr** a void pointer that will be set to jobjectRef.

See: [wolfSSL_get_jobject](#)

Return:

- SSL_SUCCESS returned if jobjectRef is properly set to objPtr.
- SSL_FAILURE returned if the function did not properly execute and jobjectRef is not set.

Example

```
WOLFSSL_CTX* ctx = wolfSSL_CTX_new( protocol method );
WOLFSSL* ssl = WOLFSSL_new();
void* objPtr = &obj;
...
if(wolfSSL_set_jobject(ssl, objPtr)){
    // The success case
}
```

17.5.2.63 function wolfSSL_get_jobject

```
WOLFSSL_API void * wolfSSL_get_jobject(
    WOLFSSL * ssl
)
```

This function returns the jobjectRef member of the WOLFSSL structure.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using [wolfSSL_new\(\)](#).

See: [wolfSSL_set_jobject](#)

Return:

- value If the WOLFSSL struct is not NULL, the function returns the jobjectRef value.
- NULL returned if the WOLFSSL struct is NULL.

Example

```

WOLFSSL_CTX* ctx = wolfSSL_CTX_new( protocol method );
WOLFSSL* ssl = wolfSSL(ctx);
...
void* jobject = wolfSSL_get_jobject(ssl);

if(jobject != NULL){
    // Success case
}

```

17.5.2.64 function wolfSSL_update_keys

```

WOLFSSL_API int wolfSSL_update_keys(
    WOLFSSL * ssl
)

```

This function is called on a TLS v1.3 client or server wolfSSL to force the rollover of keys. A KeyUpdate message is sent to the peer and new keys are calculated for encryption. The peer will send back a KeyUpdate message and the new decryption keys will then be calculated. This function can only be called after a handshake has been completed.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using [wolfSSL_new\(\)](#).

See: [wolfSSL_write](#)

Return:

- BAD_FUNC_ARG if ssl is NULL or not using TLS v1.3.
- WANT_WRITE if the writing is not ready.
- WOLFSSL_SUCCESS if successful.

Example

```

int ret;
WOLFSSL* ssl;
...
ret = wolfSSL_update_keys(ssl);
if (ret == WANT_WRITE) {
    // need to call again when I/O ready
}
else if (ret != WOLFSSL_SUCCESS) {
    // failed to send key update
}

```

17.5.2.65 function wolfSSL_key_update_response

```

WOLFSSL_API int wolfSSL_key_update_response(
    WOLFSSL * ssl,
    int * required
)

```

This function is called on a TLS v1.3 client or server wolfSSL to determine whether a rollover of keys is in progress. When [wolfSSL_update_keys\(\)](#) is called, a KeyUpdate message is sent and the encryption key is updated. The decryption key is updated when the response is received.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using [wolfSSL_new\(\)](#).
- **required** 0 when no key update response required. 1 when no key update response required.

See: [wolfSSL_update_keys](#)

Return:

- 0 on successful.
- BAD_FUNC_ARG if ssl is NULL or not using TLS v1.3.

Example

```
int ret;
WOLFSSL* ssl;
int required;
...
ret = wolfSSL_key_update_response(ssl, &required);
if (ret != 0) {
    // bad parameters
}
if (required) {
    // encrypt Key updated, awaiting response to change decrypt key
}
```

17.5.2.66 function **wolfSSL_request_certificate**

```
WOLFSSL_API int wolfSSL_request_certificate(
    WOLFSSL * ssl
)
```

This function requests a client certificate from the TLS v1.3 client. This is useful when a web server is serving some pages that require client authentication and others that don't. A maximum of 256 requests can be sent on a connection.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using [wolfSSL_new\(\)](#).

See:

- [wolfSSL_allow_post_handshake_auth](#)
- [wolfSSL_write](#)

Return:

- BAD_FUNC_ARG if ssl is NULL or not using TLS v1.3.
- WANT_WRITE if the writing is not ready.
- SIDE_ERROR if called with a client.
- NOT_READY_ERROR if called when the handshake is not finished.
- POST_HAND_AUTH_ERROR if posthandshake authentication is disallowed.
- MEMORY_E if dynamic memory allocation fails.
- WOLFSSL_SUCCESS if successful.

Example

```
int ret;
WOLFSSL* ssl;
...
ret = wolfSSL_request_certificate(ssl);
if (ret == WANT_WRITE) {
    // need to call again when I/O ready
}
else if (ret != WOLFSSL_SUCCESS) {
```

```

    // failed to request a client certificate
}

```

17.5.2.67 function wolfSSL_connect_TLSv13

```

WOLFSSL_API int wolfSSL_connect_TLSv13(
    WOLFSSL *
)

```

This function is called on the client side and initiates a TLS v1.3 handshake with a server. When this function is called, the underlying communication channel has already been set up. `wolfSSL_connect()` works with both blocking and non-blocking I/O. When the underlying I/O is non-blocking, `wolfSSL_connect()` will return when the underlying I/O could not satisfy the needs of `wolfSSL_connect` to continue the handshake. In this case, a call to `wolfSSL_get_error()` will yield either `SSL_ERROR_WANT_READ` or `SSL_ERROR_WANT_WRITE`. The calling process must then repeat the call to `wolfSSL_connect()` when the underlying I/O is ready and `wolfSSL` will pick up where it left off. When using a non-blocking socket, nothing needs to be done, but `select()` can be used to check for the required condition. If the underlying I/O is blocking, `wolfSSL_connect()` will only return once the handshake has been finished or an error occurred. `wolfSSL` takes a different approach to certificate verification than OpenSSL does. The default policy for the client is to verify the server, this means that if you don't load CAs to verify the server you'll get a connect error, unable to verify (`_155`). If you want to mimic OpenSSL behavior of having `SSL_connect` succeed even if verifying the server fails and reducing security you can do this by calling: `SSL_CTX_set_verify(ctx, SSL_VERIFY_NONE, 0)`; before calling `SSL_new()`; Though it's not recommended.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using `wolfSSL_new()`.

See:

- `wolfSSL_get_error`
- `wolfSSL_connect`
- `wolfSSL_accept_TLSv13`
- `wolfSSL_accept`

Return:

- `SSL_SUCCESS` upon success.
- `SSL_FATAL_ERROR` will be returned if an error occurred. To get a more detailed error code, call `wolfSSL_get_error()`.

Example

```

int ret = 0;
int err = 0;
WOLFSSL* ssl;
char buffer[80];
...

ret = wolfSSL_connect_TLSv13(ssl);
if (ret != SSL_SUCCESS) {
    err = wolfSSL_get_error(ssl, ret);
    printf("error = %d, %s\n", err, wolfSSL_ERR_error_string(err, buffer));
}

```

17.5.2.68 function wolfSSL_accept_TLSv13

```
WOLFSSL_API wolfSSL_accept_TLSv13(
    WOLFSSL * ssl
)
```

This function is called on the server side and waits for a SSL/TLS client to initiate the SSL/TLS handshake. When this function is called, the underlying communication channel has already been set up. `wolfSSL_accept()` will only return once the handshake has been finished or an error occurred. Call this function when expecting a TLS v1.3 connection though older version ClientHello messages are supported.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using `wolfSSL_new()`.

See:

- `wolfSSL_get_error`
- `wolfSSL_connect_TLSv13`
- `wolfSSL_connect`
- `wolfSSL_accept_TLSv13`
- `wolfSSL_accept`

Return:

- `SSL_SUCCESS` upon success.
- `SSL_FATAL_ERROR` will be returned if an error occurred. To get a more detailed error code, call `wolfSSL_get_error()`.

Example

```
int ret = 0;
int err = 0;
WOLFSSL* ssl;
char buffer[80];
...

ret = wolfSSL_accept_TLSv13(ssl);
if (ret != SSL_SUCCESS) {
    err = wolfSSL_get_error(ssl, ret);
    printf("error = %d, %s\n", err, wolfSSL_ERR_error_string(err, buffer));
}
```

17.5.2.69 function `wolfSSL_write_early_data`

```
WOLFSSL_API int wolfSSL_write_early_data(
    WOLFSSL * ssl,
    const void * data,
    int sz,
    int * outSz
)
```

This function writes early data to the server on resumption. Call this function instead of `wolfSSL_connect()` or `wolfSSL_connect_TLSv13()` to connect to the server and send the data in the handshake. This function is only used with clients.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using `wolfSSL_new()`.
- **data** the buffer holding the early data to write to server.
- **sz** the amount of early data to write in bytes.

- **outSz** the amount of early data written in bytes.

See:

- [wolfSSL_read_early_data](#)
- [wolfSSL_connect](#)
- [wolfSSL_connect_TLSv13](#)

Return:

- BAD_FUNC_ARG if a pointer parameter is NULL, sz is less than 0 or not using TLSv1.3.
- SIDE_ERROR if called with a server.
- WOLFSSL_FATAL_ERROR if the connection is not made.
- WOLFSSL_SUCCESS if successful.

Example

```
int ret = 0;
int err = 0;
WOLFSSL* ssl;
byte earlyData[] = { early data };
int outSz;
char buffer[80];
...

ret = wolfSSL_write_early_data(ssl, earlyData, sizeof(earlyData), &outSz);
if (ret != WOLFSSL_SUCCESS) {
    err = wolfSSL_get_error(ssl, ret);
    printf("error = %d, %s\n", err, wolfSSL_ERR_error_string(err, buffer));
    goto err_label;
}
if (outSz < sizeof(earlyData)) {
    // not all early data was sent
}
ret = wolfSSL_connect_TLSv13(ssl);
if (ret != SSL_SUCCESS) {
    err = wolfSSL_get_error(ssl, ret);
    printf("error = %d, %s\n", err, wolfSSL_ERR_error_string(err, buffer));
}
```

17.5.2.70 function [wolfSSL_read_early_data](#)

```
WOLFSSL_API int wolfSSL_read_early_data(
    WOLFSSL * ssl,
    void * data,
    int sz,
    int * outSz
)
```

This function reads any early data from a client on resumption. Call this function instead of [wolfSSL_accept\(\)](#) to accept a client and read any early data in the handshake. If there is no early data then the handshake will be processed as normal. This function is only used with servers.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using [wolfSSL_new\(\)](#).
- **data** a buffer to hold the early data read from client.
- **sz** size of the buffer in bytes.
- **outSz** number of bytes of early data read.

See:

- [wolfSSL_write_early_data](#)
- [wolfSSL_accept](#)
- [wolfSSL_accept_TLSv13](#)

Return:

- BAD_FUNC_ARG if a pointer parameter is NULL, sz is less than 0 or not using TLSv1.3.
- SIDE_ERROR if called with a client.
- WOLFSSL_FATAL_ERROR if accepting a connection fails.
- WOLFSSL_SUCCESS if successful.

Example

```
int ret = 0;
int err = 0;
WOLFSSL* ssl;
byte earlyData[128];
int outSz;
char buffer[80];
...

ret = wolfSSL_read_early_data(ssl, earlyData, sizeof(earlyData), &outSz);
if (ret != SSL_SUCCESS) {
    err = wolfSSL_get_error(ssl, ret);
    printf("error = %d, %s\n", err, wolfSSL_ERR_error_string(err, buffer));
}
if (outSz > 0) {
    // early data available
}
ret = wolfSSL_accept_TLSv13(ssl);
if (ret != SSL_SUCCESS) {
    err = wolfSSL_get_error(ssl, ret);
    printf("error = %d, %s\n", err, wolfSSL_ERR_error_string(err, buffer));
}
```

17.5.2.71 function wolfSSL_GetIOReadCtx

```
WOLFSSL_API void * wolfSSL_GetIOReadCtx(
    WOLFSSL * ssl
)
```

This function returns the IOCB_ReadCtx member of the WOLFSSL struct.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using [wolfSSL_new\(\)](#).

See:

- [wolfSSL_GetIOWriteCtx](#)
- [wolfSSL_SetIOReadFlags](#)
- [wolfSSL_SetIOWriteCtx](#)
- [wolfSSL_SetIOReadCtx](#)
- [wolfSSL_CTX_SetIOSend](#)

Return:

- pointer This function returns a void pointer to the IOCB_ReadCtx member of the WOLFSSL structure.
- NULL returned if the WOLFSSL struct is NULL.

Example

```
WOLFSSL* ssl = wolfSSL_new(ctx);
void* ioRead;
...
ioRead = wolfSSL_GetIOReadCtx(ssl);
if(ioRead == NULL){
    // Failure case. The ssl object was NULL.
}
```

17.5.2.72 function wolfSSL_GetIOWriteCtx

```
WOLFSSL_API void * wolfSSL_GetIOWriteCtx(
    WOLFSSL * ssl
)
```

This function returns the IOCB_WriteCtx member of the WOLFSSL structure.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using [wolfSSL_new\(\)](#).

See:

- [wolfSSL_GetIOReadCtx](#)
- [wolfSSL_SetIOWriteCtx](#)
- [wolfSSL_SetIOReadCtx](#)
- [wolfSSL_CTX_SetIOSend](#)

Return:

- pointer This function returns a void pointer to the IOCB_WriteCtx member of the WOLFSSL structure.
- NULL returned if the WOLFSSL struct is NULL.

Example

```
WOLFSSL* ssl;
void* ioWrite;
...
ioWrite = wolfSSL_GetIOWriteCtx(ssl);
if(ioWrite == NULL){
    // The function returned NULL.
}
```

17.5.2.73 function wolfSSL_SetIO_NetX

```
WOLFSSL_API void wolfSSL_SetIO_NetX(
    WOLFSSL * ssl,
    NX_TCP_SOCKET * nxsocket,
    ULONG waitoption
)
```

This function sets the nxSocket and nxWait members of the nxCtx struct within the WOLFSSL structure.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using `wolfSSL_new()`.
- **nxSocket** a pointer to type `NX_TCP_SOCKET` that is set to the `nxSocket` member of the `nxCTX` structure.
- **waitOption** a `ULONG` type that is set to the `nxWait` member of the `nxCtx` structure.

See:

- `set_fd`
- `NetX_Send`
- `NetX_Receive`

Return: none No returns.

Example

```
WOLFSSL* ssl = wolfSSL_new(ctx);
NX_TCP_SOCKET* nxSocket;
ULONG waitOption;

...
if(ssl != NULL || nxSocket != NULL || waitOption <= 0){
    wolfSSL_SetIO_NetX(ssl, nxSocket, waitOption);
} else {
    // You need to pass in good parameters.
}
```

17.6.2 Functions Documentation

17.6.2.1 function wolfSSLv23_method

```
WOLFSSL_API WOLFSSL_METHOD * wolfSSLv23_method(
    void
)
```

This function returns a WOLFSSL_METHOD similar to wolfSSLv23_client_method except that it is not determined which side yet (server/client).

Parameters:

- **none** No parameters.

See:

- [wolfSSL_new](#)
- [wolfSSL_free](#)

Return:

- WOLFSSL_METHOD* On successful creations returns a WOLFSSL_METHOD pointer
- NULL Null if memory allocation error or failure to create method

Example

```
WOLFSSL* ctx;
ctx = wolfSSL_CTX_new(wolfSSLv23_method());
// check ret value
```

17.6.2.2 function wolfSSLv3_server_method

```
WOLFSSL_API WOLFSSL_METHOD * wolfSSLv3_server_method(
    void
)
```

The `wolfSSLv3_server_method()` function is used to indicate that the application is a server and will only support the SSL 3.0 protocol. This function allocates memory for and initializes a new `wolfSSL_METHOD` structure to be used when creating the SSL/TLS context with `wolfSSL_CTX_new()`.

Parameters:

- **none** No parameters.

See:

- `wolfTLSv1_server_method`
- `wolfTLSv1_1_server_method`
- `wolfTLSv1_2_server_method`
- `wolfTLSv1_3_server_method`
- `wolfDTLSv1_server_method`
- `wolfSSLv23_server_method`
- `wolfSSL_CTX_new`

Return:

- – If successful, the call will return a pointer to the newly created `WOLFSSL_METHOD` structure.
- FAIL If memory allocation fails when calling `XMALLOC`, the failure value of the underlying `malloc()` implementation will be returned (typically `NULL` with `errno` will be set to `ENOMEM`).

Example

```
#include <wolfssl/ssl.h>

WOLFSSL_METHOD* method;
WOLFSSL_CTX* ctx;

method = wolfSSLv3_server_method();
if (method == NULL) {
    unable to get method
}

ctx = wolfSSL_CTX_new(method);
...
```

17.6.2.3 function `wolfSSLv3_client_method`

```
WOLFSSL_API WOLFSSL_METHOD * wolfSSLv3_client_method(
    void
)
```

The `wolfSSLv3_client_method()` function is used to indicate that the application is a client and will only support the SSL 3.0 protocol. This function allocates memory for and initializes a new `wolfSSL_METHOD` structure to be used when creating the SSL/TLS context with `wolfSSL_CTX_new()`.

Parameters:

- **none** No parameters.

See:

- `wolfTLSv1_client_method`
- `wolfTLSv1_1_client_method`
- `wolfTLSv1_2_client_method`
- `wolfTLSv1_3_client_method`
- `wolfDTLSv1_client_method`

- [wolfSSLv23_client_method](#)
- [wolfSSL_CTX_new](#)

Return:

- – If successful, the call will return a pointer to the newly created WOLFSSL_METHOD structure.
- FAIL If memory allocation fails when calling XMALLOC, the failure value of the underlying malloc() implementation will be returned (typically NULL with errno will be set to ENOMEM).

Example

```
#include <wolfssl/ssl.h>

WOLFSSL_METHOD* method;
WOLFSSL_CTX* ctx;

method = wolfSSLv3_client_method();
if (method == NULL) {
    unable to get method
}

ctx = wolfSSL_CTX_new(method);
...
```

17.6.2.4 function wolfTLSv1_server_method

```
WOLFSSL_API WOLFSSL_METHOD * wolfTLSv1_server_method(
    void
)
```

The wolfTLSv1_server_method() function is used to indicate that the application is a server and will only support the TLS 1.0 protocol. This function allocates memory for and initializes a new wolfSSL_METHOD structure to be used when creating the SSL/TLS context with wolfSSL_CTX_new().

Parameters:

- **none** No parameters.

See:

- [wolfSSLv3_server_method](#)
- [wolfTLSv1_1_server_method](#)
- [wolfTLSv1_2_server_method](#)
- [wolfTLSv1_3_server_method](#)
- [wolfDTLSv1_server_method](#)
- [wolfSSLv23_server_method](#)
- [wolfSSL_CTX_new](#)

Return:

- – If successful, the call will return a pointer to the newly created WOLFSSL_METHOD structure.
- FAIL If memory allocation fails when calling XMALLOC, the failure value of the underlying malloc() implementation will be returned (typically NULL with errno will be set to ENOMEM).

Example

```
#include <wolfssl/ssl.h>

WOLFSSL_METHOD* method;
WOLFSSL_CTX* ctx;
```

```

method = wolfTLSv1_server_method();
if (method == NULL) {
    unable to get method
}

ctx = wolfSSL_CTX_new(method);
...

```

17.6.2.5 function `wolfTLSv1_client_method`

```

WOLFSSL_API WOLFSSL_METHOD * wolfTLSv1_client_method(
    void
)

```

The `wolfTLSv1_client_method()` function is used to indicate that the application is a client and will only support the TLS 1.0 protocol. This function allocates memory for and initializes a new `wolfSSL_METHOD` structure to be used when creating the SSL/TLS context with `wolfSSL_CTX_new()`.

Parameters:

- **none** No parameters.

See:

- [wolfSSLv3_client_method](#)
- [wolfTLSv1_1_client_method](#)
- [wolfTLSv1_2_client_method](#)
- [wolfTLSv1_3_client_method](#)
- [wolfDTLSv1_client_method](#)
- [wolfSSLv23_client_method](#)
- [wolfSSL_CTX_new](#)

Return:

- – If successful, the call will return a pointer to the newly created `WOLFSSL_METHOD` structure.
- FAIL If memory allocation fails when calling `XMALLOC`, the failure value of the underlying `malloc()` implementation will be returned (typically `NULL` with `errno` will be set to `ENOMEM`).

Example

```

#include <wolfssl/ssl.h>

WOLFSSL_METHOD* method;
WOLFSSL_CTX* ctx;

method = wolfTLSv1_client_method();
if (method == NULL) {
    unable to get method
}

ctx = wolfSSL_CTX_new(method);
...

```

17.6.2.6 function `wolfTLSv1_1_server_method`

```

WOLFSSL_API WOLFSSL_METHOD * wolfTLSv1_1_server_method(
    void
)

```

)

The `wolfTLSv1_1_server_method()` function is used to indicate that the application is a server and will only support the TLS 1.1 protocol. This function allocates memory for and initializes a new `wolfSSL_METHOD` structure to be used when creating the SSL/TLS context with `wolfSSL_CTX_new()`.

Parameters:

- **none** No parameters.

See:

- `wolfSSLv3_server_method`
- `wolfTLSv1_server_method`
- `wolfTLSv1_2_server_method`
- `wolfTLSv1_3_server_method`
- `wolfDTLSv1_server_method`
- `wolfSSLv23_server_method`
- `wolfSSL_CTX_new`

Return:

- – If successful, the call will return a pointer to the newly created `WOLFSSL_METHOD` structure.
- FAIL If memory allocation fails when calling `XMALLOC`, the failure value of the underlying `malloc()` implementation will be returned (typically `NULL` with `errno` will be set to `ENOMEM`).

Example

```
#include <wolfssl/ssl.h>

WOLFSSL_METHOD* method;
WOLFSSL_CTX* ctx;

method = wolfTLSv1_1_server_method();
if (method == NULL) {
    // unable to get method
}

ctx = wolfSSL_CTX_new(method);
...
```

17.6.2.7 function `wolfTLSv1_1_client_method`

```
WOLFSSL_API WOLFSSL_METHOD * wolfTLSv1_1_client_method(
    void
)
```

The `wolfTLSv1_1_client_method()` function is used to indicate that the application is a client and will only support the TLS 1.0 protocol. This function allocates memory for and initializes a new `wolfSSL_METHOD` structure to be used when creating the SSL/TLS context with `wolfSSL_CTX_new()`.

Parameters:

- **none** No parameters.

See:

- `wolfSSLv3_client_method`
- `wolfTLSv1_client_method`
- `wolfTLSv1_2_client_method`
- `wolfTLSv1_3_client_method`

- [wolfDTLSv1_client_method](#)
- [wolfSSLv23_client_method](#)
- [wolfSSL_CTX_new](#)

Return:

- – If successful, the call will return a pointer to the newly created WOLFSSL_METHOD structure.
- FAIL If memory allocation fails when calling XMALLOC, the failure value of the underlying malloc() implementation will be returned (typically NULL with errno will be set to ENOMEM).

Example

```
#include <wolfssl/ssl.h>

WOLFSSL_METHOD* method;
WOLFSSL_CTX* ctx;

method = wolfTLSv1_1_client_method();
if (method == NULL) {
    // unable to get method
}

ctx = wolfSSL_CTX_new(method);
...
```

17.6.2.8 function wolfTLSv1_2_server_method

```
WOLFSSL_API WOLFSSL_METHOD * wolfTLSv1_2_server_method(
    void
)
```

The wolfTLSv1_2_server_method() function is used to indicate that the application is a server and will only support the TLS 1.2 protocol. This function allocates memory for and initializes a new wolfSSL_METHOD structure to be used when creating the SSL/TLS context with wolfSSL_CTX_new().

Parameters:

- **none** No parameters.

See:

- [wolfSSLv3_server_method](#)
- [wolfTLSv1_server_method](#)
- [wolfTLSv1_1_server_method](#)
- [wolfTLSv1_3_server_method](#)
- [wolfDTLSv1_server_method](#)
- [wolfSSLv23_server_method](#)
- [wolfSSL_CTX_new](#)

Return:

- – If successful, the call will return a pointer to the newly created WOLFSSL_METHOD structure.
- FAIL If memory allocation fails when calling XMALLOC, the failure value of the underlying malloc() implementation will be returned (typically NULL with errno will be set to ENOMEM).

Example

```
#include <wolfssl/ssl.h>

WOLFSSL_METHOD* method;
```

```

WOLFSSL_CTX* ctx;

method = wolfTLSv1_2_server_method();
if (method == NULL) {
    // unable to get method
}

ctx = wolfSSL_CTX_new(method);
...

```

17.6.2.9 function wolfTLSv1_2_client_method

```

WOLFSSL_API WOLFSSL_METHOD * wolfTLSv1_2_client_method(
    void
)

```

The wolfTLSv1_2_client_method() function is used to indicate that the application is a client and will only support the TLS 1.2 protocol. This function allocates memory for and initializes a new wolfSSL_METHOD structure to be used when creating the SSL/TLS context with wolfSSL_CTX_new().

Parameters:

- **none** No parameters.

See:

- [wolfSSLv3_client_method](#)
- [wolfTLSv1_client_method](#)
- [wolfTLSv1_1_client_method](#)
- [wolfTLSv1_3_client_method](#)
- [wolfDTLSv1_client_method](#)
- [wolfSSLv23_client_method](#)
- [wolfSSL_CTX_new](#)

Return:

- – If successful, the call will return a pointer to the newly created WOLFSSL_METHOD structure.
- FAIL If memory allocation fails when calling XMALLOC, the failure value of the underlying malloc() implementation will be returned (typically NULL with errno will be set to ENOMEM).

Example

```

#include <wolfssl/ssl.h>

WOLFSSL_METHOD* method;
WOLFSSL_CTX* ctx;

method = wolfTLSv1_2_client_method();
if (method == NULL) {
    // unable to get method
}

ctx = wolfSSL_CTX_new(method);
...

```

17.6.2.10 function wolfDTLSv1_client_method

```
WOLFSSL_API WOLFSSL_METHOD * wolfDTLSv1_client_method(
    void
)
```

The `wolfDTLSv1_client_method()` function is used to indicate that the application is a client and will only support the DTLS 1.0 protocol. This function allocates memory for and initializes a new `wolfSSL_METHOD` structure to be used when creating the SSL/TLS context with `wolfSSL_CTX_new()`. This function is only available when wolfSSL has been compiled with DTLS support (`-enable-dtls`, or by defining `wolfSSL_DTLS`).

Parameters:

- **none** No parameters.

See:

- `wolfSSLv3_client_method`
- `wolfTLSv1_client_method`
- `wolfTLSv1_1_client_method`
- `wolfTLSv1_2_client_method`
- `wolfTLSv1_3_client_method`
- `wolfSSLv23_client_method`
- `wolfSSL_CTX_new`

Return:

- – If successful, the call will return a pointer to the newly created `WOLFSSL_METHOD` structure.
- FAIL If memory allocation fails when calling `XMALLOC`, the failure value of the underlying `malloc()` implementation will be returned (typically `NULL` with `errno` will be set to `ENOMEM`).

Example

```
WOLFSSL_METHOD* method;
WOLFSSL_CTX* ctx;

method = wolfDTLSv1_client_method();
if (method == NULL) {
    // unable to get method
}

ctx = wolfSSL_CTX_new(method);
...
```

17.6.2.11 function `wolfDTLSv1_server_method`

```
WOLFSSL_API WOLFSSL_METHOD * wolfDTLSv1_server_method(
    void
)
```

The `wolfDTLSv1_server_method()` function is used to indicate that the application is a server and will only support the DTLS 1.0 protocol. This function allocates memory for and initializes a new `wolfSSL_METHOD` structure to be used when creating the SSL/TLS context with `wolfSSL_CTX_new()`. This function is only available when wolfSSL has been compiled with DTLS support (`-enable-dtls`, or by defining `wolfSSL_DTLS`).

Parameters:

- **none** No parameters.

See:

- `wolfSSLv3_server_method`
- `wolfTLSv1_server_method`
- `wolfTLSv1_1_server_method`
- `wolfTLSv1_2_server_method`
- `wolfTLSv1_3_server_method`
- `wolfSSLv23_server_method`
- `wolfSSL_CTX_new`

Return:

- – If successful, the call will return a pointer to the newly created `WOLFSSL_METHOD` structure.
- FAIL If memory allocation fails when calling `XMALLOC`, the failure value of the underlying `malloc()` implementation will be returned (typically `NULL` with `errno` will be set to `ENOMEM`).

Example

```
WOLFSSL_METHOD* method;
WOLFSSL_CTX* ctx;

method = wolfDTLSv1_server_method();
if (method == NULL) {
    // unable to get method
}

ctx = wolfSSL_CTX_new(method);
...
```

17.6.2.12 function `wolfSSL_use_old_poly`

```
WOLFSSL_API int wolfSSL_use_old_poly(
    WOLFSSL * ,
    int
)
```

Since there is some differences between the first release and newer versions of chacha-poly AEAD construction we have added an option to communicate with servers/clients using the older version. By default `wolfSSL` uses the new version.

Parameters:

- **ssl** a pointer to a `WOLFSSL` structure, created using `wolfSSL_new()`.
- **value** whether or not to use the older version of setting up the information for poly1305. Passing a flag value of 1 indicates yes use the old poly AEAD, to switch back to using the new version pass a flag value of 0.

See: none

Return: 0 upon success

Example

```
int ret = 0;
WOLFSSL* ssl;
...

ret = wolfSSL_use_old_poly(ssl, 1);
if (ret != 0) {
    // failed to set poly1305 AEAD version
}
```

17.6.2.13 function wolfSSL_CTX_trust_peer_cert

```
WOLFSSL_API int wolfSSL_CTX_trust_peer_cert(
    WOLFSSL_CTX * ,
    const char * ,
    int
)
```

This function loads a certificate to use for verifying a peer when performing a TLS/SSL handshake. The peer certificate sent during the handshake is compared by using the SKID when available and the signature. If these two things do not match then any loaded CAs are used. Feature is enabled by defining the macro WOLFSSL_TRUST_PEER_CERT. Please see the examples for proper usage.

Parameters:

- **ctx** pointer to the SSL context, created with [wolfSSL_CTX_new\(\)](#).
- **file** pointer to name of the file containing certificates
- **type** type of certificate being loaded ie SSL_FILETYPE_ASN1 or SSL_FILETYPE_PEM.

See:

- [wolfSSL_CTX_load_verify_buffer](#)
- [wolfSSL_CTX_use_certificate_file](#)
- [wolfSSL_CTX_use_PrivateKey_file](#)
- [wolfSSL_CTX_use_certificate_chain_file](#)
- [wolfSSL_CTX_trust_peer_buffer](#)
- [wolfSSL_CTX_Unload_trust_peers](#)
- [wolfSSL_use_certificate_file](#)
- [wolfSSL_use_PrivateKey_file](#)
- [wolfSSL_use_certificate_chain_file](#)

Return:

- SSL_SUCCESS upon success.
- SSL_FAILURE will be returned if ctx is NULL, or if both file and type are invalid.
- SSL_BAD_FILETYPE will be returned if the file is the wrong format.
- SSL_BAD_FILE will be returned if the file doesn't exist, can't be read, or is corrupted.
- MEMORY_E will be returned if an out of memory condition occurs.
- ASN_INPUT_E will be returned if Base16 decoding fails on the file.

Example

```
int ret = 0;
WOLFSSL_CTX* ctx = wolfSSL_CTX_new( protocol method );
...

ret = wolfSSL_CTX_trust_peer_cert(ctx, "../peer-cert.pem",
SSL_FILETYPE_PEM);
if (ret != SSL_SUCCESS) {
    // error loading trusted peer cert
}
...
```

17.6.2.14 function wolfSSL_CTX_get_verify_depth

```
WOLFSSL_API long wolfSSL_CTX_get_verify_depth(
    WOLFSSL_CTX * ctx
)
```

This function gets the certificate chaining depth using the CTX structure.

Parameters:

- **ctx** a pointer to a WOLFSSL_CTX structure, created using `wolfSSL_CTX_new()`.

See:

- `wolfSSL_CTX_use_certificate_chain_file`
- `wolfSSL_get_verify_depth`

Return:

- MAX_CHAIN_DEPTH returned if the CTX struct is not NULL. The constant representation of the max certificate chain peer depth.
- BAD_FUNC_ARG returned if the CTX structure is NULL.

Example

```
WOLFSSL_METHOD method; // protocol method
WOLFSSL_CTX* ctx = WOLFSSL_CTX_new(method);
...
long ret = wolfSSL_CTX_get_verify_depth(ctx);

if(ret == EXPECTED){
    // You have the expected value
} else {
    // Handle an unexpected depth
}
```

17.6.2.15 function `wolfSSL_CTX_new`

```
WOLFSSL_API WOLFSSL_CTX * wolfSSL_CTX_new(
    WOLFSSL_METHOD *
)
```

This function creates a new SSL context, taking a desired SSL/TLS protocol method for input.

Parameters:

- **method** pointer to the desired WOLFSSL_METHOD to use for the SSL context. This is created using one of the `wolfSSLvXX_XXXX_method()` functions to specify SSL/TLS/DTLS protocol level.

See: `wolfSSL_new`

Return:

- pointer If successful the call will return a pointer to the newly-created WOLFSSL_CTX.
- NULL upon failure.

Example

```
WOLFSSL_CTX* ctx = 0;
WOLFSSL_METHOD* method = 0;

method = wolfSSLv3_client_method();
if (method == NULL) {
    // unable to get method
}

ctx = wolfSSL_CTX_new(method);
if (ctx == NULL) {
```

```

    // context creation failed
}

```

17.6.2.16 function `wolfSSL_new`

```

WOLFSSL_API WOLFSSL * wolfSSL_new(
    WOLFSSL_CTX *
)

```

This function creates a new SSL session, taking an already created SSL context as input.

Parameters:

- **ctx** pointer to the SSL context, created with `wolfSSL_CTX_new()`.

See: `wolfSSL_CTX_new`

Return:

- – If successful the call will return a pointer to the newly-created `wolfSSL` structure.
- NULL Upon failure.

Example

```

#include <wolfssl/ssl.h>

WOLFSSL*      ssl = NULL;
WOLFSSL_CTX*  ctx = 0;

ctx = wolfSSL_CTX_new(method);
if (ctx == NULL) {
    // context creation failed
}

ssl = wolfSSL_new(ctx);
if (ssl == NULL) {
    // SSL object creation failed
}

```

17.6.2.17 function `wolfSSL_set_fd`

```

WOLFSSL_API int wolfSSL_set_fd(
    WOLFSSL * ,
    int
)

```

This function assigns a file descriptor (fd) as the input/output facility for the SSL connection. Typically this will be a socket file descriptor.

Parameters:

- **ssl** pointer to the SSL session, created with `wolfSSL_new()`.
- **fd** file descriptor to use with SSL/TLS connection.

See:

- `wolfSSL_CTX_SetIOSend`
- `wolfSSL_CTX_SetIORecv`
- `wolfSSL_SetIOReadCtx`
- `wolfSSL_SetIOWriteCtx`

Return:

- `SSL_SUCCESS` upon success.
- `Bad_FUNC_ARG` upon failure.

Example

```
int sockfd;
WOLFSSL* ssl = 0;
...

ret = wolfSSL_set_fd(ssl, sockfd);
if (ret != SSL_SUCCESS) {
    // failed to set SSL file descriptor
}
```

17.6.2.18 function `wolfSSL_set_using_nonblock`

```
WOLFSSL_API void wolfSSL_set_using_nonblock(
    WOLFSSL * ,
    int
)
```

This function informs the WOLFSSL object that the underlying I/O is non-blocking. After an application creates a WOLFSSL object, if it will be used with a non-blocking socket, call `wolfSSL_set_using_nonblock()` on it. This lets the WOLFSSL object know that receiving `EWOULDBLOCK` means that the `recvfrom` call would block rather than that it timed out.

Parameters:

- **ssl** pointer to the SSL session, created with `wolfSSL_new()`.
- **nonblock** value used to set non-blocking flag on WOLFSSL object. Use 1 to specify non-blocking, otherwise 0.

See:

- `wolfSSL_get_using_nonblock`
- `wolfSSL_dtls_got_timeout`
- `wolfSSL_dtls_get_current_timeout`

Return: none No return.

Example

```
WOLFSSL* ssl = 0;
...
wolfSSL_set_using_nonblock(ssl, 1);
```

17.6.2.19 function `wolfSSL_CTX_free`

```
WOLFSSL_API void wolfSSL_CTX_free(
    WOLFSSL_CTX *
)
```

This function frees an allocated WOLFSSL_CTX object. This function decrements the CTX reference count and only frees the context when the reference count has reached 0.

Parameters:

- **ctx** pointer to the SSL context, created with `wolfSSL_CTX_new()`.

See:

- [wolfSSL_CTX_new](#)
- [wolfSSL_new](#)
- [wolfSSL_free](#)

Return: none No return.

Example

```
WOLFSSL_CTX* ctx = 0;
...
wolfSSL_CTX_free(ctx);
```

17.6.2.20 function [wolfSSL_free](#)

```
WOLFSSL_API void wolfSSL_free(
    WOLFSSL *
```

)

This function frees an allocated wolfSSL object.

Parameters:

- **ssl** pointer to the SSL object, created with [wolfSSL_new\(\)](#).

See:

- [wolfSSL_CTX_new](#)
- [wolfSSL_new](#)
- [wolfSSL_CTX_free](#)

Return: none No return.

Example

```
#include <wolfssl/ssl.h>

WOLFSSL* ssl = 0;
...
wolfSSL_free(ssl);
```

17.6.2.21 function [wolfSSL_set_session](#)

```
WOLFSSL_API int wolfSSL_set_session(
    WOLFSSL * ,
    WOLFSSL_SESSION *
```

)

This function sets the session to be used when the SSL object, ssl, is used to establish a SSL/TLS connection. For session resumption, before calling [wolfSSL_shutdown\(\)](#) with your session object, an application should save the session ID from the object with a call to [wolfSSL_get_session\(\)](#), which returns a pointer to the session. Later, the application should create a new WOLFSSL object and assign the saved session with [wolfSSL_set_session\(\)](#). At this point, the application may call [wolfSSL_connect\(\)](#) and wolfSSL will try to resume the session. The wolfSSL server code allows session resumption by default.

Parameters:

- **ssl** pointer to the SSL object, created with [wolfSSL_new\(\)](#).
- **session** pointer to the WOLFSSL_SESSION used to set the session for ssl.

See: [wolfSSL_get_session](#)

Return:

- `SSL_SUCCESS` will be returned upon successfully setting the session.
- `SSL_FAILURE` will be returned on failure. This could be caused by the session cache being disabled, or if the session has timed out.
- When `OPENSSL_EXTRA` and `WOLFSSL_ERROR_CODE_OPENSSL` are defined, `SSL_SUCCESS` will be returned even if the session has timed out.

Example

```
int ret = 0;
WOLFSSL* ssl = 0;
WOLFSSL_SESSION* session;
...

ret = wolfSSL_get_session(ssl, session);
if (ret != SSL_SUCCESS) {
    // failed to set the SSL session
}
...
```

17.6.2.22 function `wolfSSL_CTX_set_verify`

```
WOLFSSL_API void wolfSSL_CTX_set_verify(
    WOLFSSL_CTX * ,
    int ,
    VerifyCallback verify_callback
)
```

This function sets the verification method for remote peers and also allows a verify callback to be registered with the SSL context. The verify callback will be called only when a verification failure has occurred. If no verify callback is desired, the NULL pointer can be used for `verify_callback`. The verification mode of peer certificates is a logically OR'd list of flags. The possible flag values include:

`SSL_VERIFY_NONE` Client mode: the client will not verify the certificate received from the server and the handshake will continue as normal. Server mode: the server will not send a certificate request to the client. As such, client verification will not be enabled.

`SSL_VERIFY_PEER` Client mode: the client will verify the certificate received from the server during the handshake. This is turned on by default in `wolfSSL`, therefore, using this option has no effect. Server mode: the server will send a certificate request to the client and verify the client certificate received.

`SSL_VERIFY_FAIL_IF_NO_PEER_CERT` Client mode: no effect when used on the client side. Server mode: the verification will fail on the server side if the client fails to send a certificate when requested to do so (when using `SSL_VERIFY_PEER` on the SSL server).

`SSL_VERIFY_FAIL_EXCEPT_PSK` Client mode: no effect when used on the client side. Server mode: the verification is the same as `SSL_VERIFY_FAIL_IF_NO_PEER_CERT` except in the case of a PSK connection. If a PSK connection is being made then the connection will go through without a peer cert.

Parameters:

- **ctx** pointer to the SSL context, created with `wolfSSL_CTX_new()`.
- **mode** session timeout value in seconds
- **verify_callback** callback to be called when verification fails. If no callback is desired, the NULL pointer can be used for `verify_callback`.

See: `wolfSSL_set_verify`

Return: none No return.

Example

```
WOLFSSL_CTX* ctx = 0;
...
```

```
wolfSSL_CTX_set_verify(ctx, SSL_VERIFY_PEER |
                        SSL_VERIFY_FAIL_IF_NO_PEER_CERT, 0);
```

17.6.2.23 function `wolfSSL_set_verify`

```
WOLFSSL_API void wolfSSL_set_verify(
    WOLFSSL * ,
    int ,
    VerifyCallback verify_callback
)
```

This function sets the verification method for remote peers and also allows a verify callback to be registered with the SSL session. The verify callback will be called only when a verification failure has occurred. If no verify callback is desired, the NULL pointer can be used for `verify_callback`. The verification mode of peer certificates is a logically OR'd list of flags. The possible flag values include: `SSL_VERIFY_NONE` Client mode: the client will not verify the certificate received from the server and the handshake will continue as normal. Server mode: the server will not send a certificate request to the client. As such, client verification will not be enabled. `SSL_VERIFY_PEER` Client mode: the client will verify the certificate received from the server during the handshake. This is turned on by default in `wolfSSL`, therefore, using this option has no effect. Server mode: the server will send a certificate request to the client and verify the client certificate received. `SSL_VERIFY_FAIL_IF_NO_PEER_CERT` Client mode: no effect when used on the client side. Server mode: the verification will fail on the server side if the client fails to send a certificate when requested to do so (when using `SSL_VERIFY_PEER` on the SSL server). `SSL_VERIFY_FAIL_EXCEPT_PSK` Client mode: no effect when used on the client side. Server mode: the verification is the same as `SSL_VERIFY_FAIL_IF_NO_PEER_CERT` except in the case of a PSK connection. If a PSK connection is being made then the connection will go through without a peer cert.

Parameters:

- **ssl** pointer to the SSL session, created with `wolfSSL_new()`.
- **mode** session timeout value in seconds.
- **verify_callback** callback to be called when verification fails. If no callback is desired, the NULL pointer can be used for `verify_callback`.

See: `wolfSSL_CTX_set_verify`

Return: none No return.

Example

```
WOLFSSL* ssl = 0;
...
wolfSSL_set_verify(ssl, SSL_VERIFY_PEER | SSL_VERIFY_FAIL_IF_NO_PEER_CERT, 0);
```

17.6.2.24 function `wolfSSL_CTX_set_session_cache_mode`

```
WOLFSSL_API long wolfSSL_CTX_set_session_cache_mode(
    WOLFSSL_CTX * ,
    long
)
```

This function enables or disables SSL session caching. Behavior depends on the value used for mode. The following values for mode are available: `SSL_SESS_CACHE_OFF`- disable session caching. Session caching is turned on by default. `SSL_SESS_CACHE_NO_AUTO_CLEAR` - Disable auto-flushing of the session cache. Auto-flushing is turned on by default.

Parameters:

- **ctx** pointer to the SSL context, created with `wolfSSL_CTX_new()`.
- **mode** modifier used to change behavior of the session cache.

See:

- `wolfSSL_flush_sessions`
- `wolfSSL_get_session`
- `wolfSSL_set_session`
- `wolfSSL_get_sessionID`
- `wolfSSL_CTX_set_timeout`

Return: SSL_SUCCESS will be returned upon success.

Example

```
WOLFSSL_CTX* ctx = 0;
...
ret = wolfSSL_CTX_set_session_cache_mode(ctx, SSL_SESS_CACHE_OFF);
if (ret != SSL_SUCCESS) {
    // failed to turn SSL session caching off
}
```

17.6.2.25 function `wolfSSL_CTX_memrestore_cert_cache`

```
WOLFSSL_API int wolfSSL_CTX_memrestore_cert_cache(
    WOLFSSL_CTX *,
    const void *,
    int
)
```

This function restores the certificate cache from memory.

Parameters:

- **ctx** a pointer to a WOLFSSL_CTX structure, created using `wolfSSL_CTX_new()`.
- **mem** a void pointer with a value that will be restored to the certificate cache.
- **sz** an int type that represents the size of the mem parameter.

See: CM_MemRestoreCertCache

Return:

- SSL_SUCCESS returned if the function and subroutines executed without an error.
- BAD_FUNC_ARG returned if the ctx or mem parameters are NULL or if the sz parameter is less than or equal to zero.
- BUFFER_E returned if the cert cache memory buffer is too small.
- CACHE_MATCH_ERROR returned if there was a cert cache header mismatch.
- BAD_MUTEX_E returned if the lock mutex on failed.

Example

```
WOLFSSL_CTX* ctx = WOLFSSL_CTX_new( protocol method );
WOLFSSL* ssl = WOLFSSL_new(ctx);
void* mem;
int sz = (*int) sizeof(mem);
...
if(wolfSSL_CTX_memrestore_cert_cache(ssl->ctx, mem, sz)){
    // The success case
}
```

17.6.2.26 function wolfSSL_CTX_set_cipher_list

```
WOLFSSL_API int wolfSSL_CTX_set_cipher_list(  
    WOLFSSL_CTX * ,  
    const char *  
)
```

This function sets cipher suite list for a given WOLFSSL_CTX. This cipher suite list becomes the default list for any new SSL sessions (WOLFSSL) created using this context. The ciphers in the list should be sorted in order of preference from highest to lowest. Each call to wolfSSL_CTX_set_cipher_list() resets the cipher suite list for the specific SSL context to the provided list each time the function is called. The cipher suite list, list, is a null-terminated text string, and a colon-delimited list. For example, one value for list may be "DHE-RSA-AES256-SHA256:DHE-RSA-AES128-SHA256:AES256-SHA256". Valid cipher values are the full name values from the cipher_names[] array in src/internal.c (for a definite list of valid cipher values check src/internal.c)

Parameters:

- **ctx** pointer to the SSL context, created with [wolfSSL_CTX_new\(\)](#).
- **list** null-terminated text string and a colon-delimited list of cipher suites to use with the specified SSL context.

See:

- [wolfSSL_set_cipher_list](#)
- [wolfSSL_CTX_new](#)

Return:

- SSL_SUCCESS will be returned upon successful function completion.
- SSL_FAILURE will be returned on failure.

Example

```
WOLFSSL_CTX* ctx = 0;  
...  
ret = wolfSSL_CTX_set_cipher_list(ctx,  
    "DHE-RSA-AES256-SHA256:DHE-RSA-AES128-SHA256:AES256-SHA256");  
if (ret != SSL_SUCCESS) {  
    // failed to set cipher suite list  
}
```

17.6.2.27 function wolfSSL_set_cipher_list

```
WOLFSSL_API int wolfSSL_set_cipher_list(  
    WOLFSSL * ,  
    const char *  
)
```

This function sets cipher suite list for a given WOLFSSL object (SSL session). The ciphers in the list should be sorted in order of preference from highest to lowest. Each call to wolfSSL_set_cipher_list() resets the cipher suite list for the specific SSL session to the provided list each time the function is called. The cipher suite list, list, is a null-terminated text string, and a colon-delimited list. For example, one value for list may be "DHE-RSA-AES256-SHA256:DHE-RSA-AES128-SHA256:AES256-SHA256". Valid cipher values are the full name values from the cipher_names[] array in src/internal.c (for a definite list of valid cipher values check src/internal.c)

Parameters:

- **ssl** pointer to the SSL session, created with [wolfSSL_new\(\)](#).

- **list** null-terminated text string and a colon-delimited list of cipher suites to use with the specified SSL session.

See:

- [wolfSSL_CTX_set_cipher_list](#)
- [wolfSSL_new](#)

Return:

- SSL_SUCCESS will be returned upon successful function completion.
- SSL_FAILURE will be returned on failure.

Example

```
int ret = 0;
WOLFSSL* ssl = 0;
...
ret = wolfSSL_set_cipher_list(ssl,
"DHE-RSA-AES256-SHA256:DHE-RSA-AES128-SHA256:AES256-SHA256");
if (ret != SSL_SUCCESS) {
    // failed to set cipher suite list
}
```

17.6.2.28 function wolfSSL_dtls_set_timeout_init

```
WOLFSSL_API int wolfSSL_dtls_set_timeout_init(
    WOLFSSL * ssl,
    int
)
```

This function sets the dtls timeout.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using [wolfSSL_new\(\)](#).
- **timeout** an int type that will be set to the dtls_timeout_init member of the WOLFSSL structure.

See:

- [wolfSSL_dtls_set_timeout_max](#)
- [wolfSSL_dtls_get_timeout](#)

Return:

- SSL_SUCCESS returned if the function executes without an error. The dtls_timeout_init and the dtls_timeout members of SSL have been set.
- BAD_FUNC_ARG returned if the WOLFSSL struct is NULL or if the timeout is not greater than 0. It will also return if the timeout argument exceeds the maximum value allowed.

Example

```
WOLFSSL_CTX* ctx = wolfSSL_CTX_new( method );
WOLFSSL* ssl = wolfSSL_new(ctx);
int timeout = TIMEOUT;
...
if(wolfSSL_dtls_set_timeout_init(ssl, timeout)){
    // the dtls timeout was set
} else {
    // Failed to set DTLS timeout.
}
```

17.6.2.29 function wolfSSL_get1_session

```
WOLFSSL_API WOLFSSL_SESSION * wolfSSL_get1_session(  
    WOLFSSL * ssl  
)
```

This function returns the WOLFSSL_SESSION from the WOLFSSL structure.

Parameters:

- **ssl** WOLFSSL structure to get session from.

See:

- [wolfSSL_new](#)
- [wolfSSL_free](#)

Return:

- WOLFSSL_SESSION On success return session pointer.
- NULL on failure returns NULL.

Example

```
WOLFSSL* ssl;  
WOLFSSL_SESSION* ses;  
// attempt/complete handshake  
ses = wolfSSL_get1_session(ssl);  
// check ses information
```

17.6.2.30 function wolfSSLv23_client_method

```
WOLFSSL_API WOLFSSL_METHOD * wolfSSLv23_client_method(  
    void  
)
```

The wolfSSLv23_client_method() function is used to indicate that the application is a client and will support the highest protocol version supported by the server between SSL 3.0 - TLS 1.3. This function allocates memory for and initializes a new WOLFSSL_METHOD structure to be used when creating the SSL/TLS context with [wolfSSL_CTX_new\(\)](#). Both wolfSSL clients and servers have robust version downgrade capability. If a specific protocol version method is used on either side, then only that version will be negotiated or an error will be returned. For example, a client that uses TLSv1 and tries to connect to a SSLv3 only server will fail, likewise connecting to a TLSv1.1 will fail as well. To resolve this issue, a client that uses the wolfSSLv23_client_method() function will use the highest protocol version supported by the server and downgrade to SSLv3 if needed. In this case, the client will be able to connect to a server running SSLv3 - TLSv1.3.

Parameters:

- **none** No parameters

See:

- [wolfSSLv3_client_method](#)
- [wolfTLSv1_client_method](#)
- [wolfTLSv1_1_client_method](#)
- [wolfTLSv1_2_client_method](#)
- [wolfTLSv1_3_client_method](#)
- [wolfDTLSv1_client_method](#)
- [wolfSSL_CTX_new](#)

Return:

- pointer upon success a pointer to a WOLFSSL_METHOD.
- Failure If memory allocation fails when calling XMALLOC, the failure value of the underlying malloc() implementation will be returned (typically NULL with errno will be set to ENOMEM).

Example

```
WOLFSSL_METHOD* method;
WOLFSSL_CTX* ctx;
method = wolfSSLv23_client_method();
if (method == NULL) {
    // unable to get method
}

ctx = wolfSSL_CTX_new(method);
...
```

17.6.2.31 function wolfSSL_ASN1_INTEGER_to_BN

```
WOLFSSL_API WOLFSSL_BIGNUM * wolfSSL_ASN1_INTEGER_to_BN(
    const WOLFSSL_ASN1_INTEGER * ai,
    WOLFSSL_BIGNUM * bn
)
```

This function is used to copy a WOLFSSL_ASN1_INTEGER value to a WOLFSSL_BIGNUM structure.

Parameters:

- **ai** WOLFSSL_ASN1_INTEGER structure to copy from.
- **bn** if wanting to copy into an already existing WOLFSSL_BIGNUM struct then pass in a pointer to it. Optionally this can be NULL and a new WOLFSSL_BIGNUM structure will be created.

See: none

Return:

- pointer On successfully copying the WOLFSSL_ASN1_INTEGER value a WOLFSSL_BIGNUM pointer is returned.
- Null upon failure.

Example

```
WOLFSSL_ASN1_INTEGER* ai;
WOLFSSL_BIGNUM* bn;
// create ai
bn = wolfSSL_ASN1_INTEGER_to_BN(ai, NULL);

// or if having already created bn and wanting to reuse structure
// wolfSSL_ASN1_INTEGER_to_BN(ai, bn);
// check bn is or return value is not NULL
```

17.6.2.32 function wolfSSL_CTX_add_extra_chain_cert

```
WOLFSSL_API long wolfSSL_CTX_add_extra_chain_cert(
    WOLFSSL_CTX * ,
    WOLFSSL_X509 *
)
```

This function adds the certificate to the internal chain being built in the WOLFSSL_CTX structure.

Parameters:

- **ctx** WOLFSSL_CTX structure to add certificate to.
- **x509** certificate to add to the chain.

See:

- [wolfSSL_CTX_new](#)
- [wolfSSL_CTX_free](#)

Return:

- SSL_SUCCESS after successfully adding the certificate.
- SSL_FAILURE if failing to add the certificate to the chain.

Example

```
WOLFSSL_CTX* ctx;
WOLFSSL_X509* x509;
int ret;
// create ctx
ret = wolfSSL_CTX_add_extra_chain_cert(ctx, x509);
// check ret value
```

17.6.2.33 function wolfSSL_CTX_get_read_ahead

```
WOLFSSL_API int wolfSSL_CTX_get_read_ahead(
    WOLFSSL_CTX *
```

This function returns the get read ahead flag from a WOLFSSL_CTX structure.

Parameters:

- **ctx** WOLFSSL_CTX structure to get read ahead flag from.

See:

- [wolfSSL_CTX_new](#)
- [wolfSSL_CTX_free](#)
- [wolfSSL_CTX_set_read_ahead](#)

Return:

- flag On success returns the read ahead flag.
- SSL_FAILURE If ctx is NULL then SSL_FAILURE is returned.

Example

```
WOLFSSL_CTX* ctx;
int flag;
// setup ctx
flag = wolfSSL_CTX_get_read_ahead(ctx);
//check flag
```

17.6.2.34 function wolfSSL_CTX_set_read_ahead

```
WOLFSSL_API int wolfSSL_CTX_set_read_ahead(
    WOLFSSL_CTX * ,
    int v
)
```

This function sets the read ahead flag in the WOLFSSL_CTX structure.

Parameters:

- **ctx** WOLFSSL_CTX structure to set read ahead flag.

See:

- [wolfSSL_CTX_new](#)
- [wolfSSL_CTX_free](#)
- [wolfSSL_CTX_get_read_ahead](#)

Return:

- SSL_SUCCESS If ctx read ahead flag set.
- SSL_FAILURE If ctx is NULL then SSL_FAILURE is returned.

Example

```
WOLFSSL_CTX* ctx;
int flag;
int ret;
// setup ctx
ret = wolfSSL_CTX_set_read_ahead(ctx, flag);
// check return value
```

17.6.2.35 function `wolfSSL_CTX_set_tlsext_status_arg`

```
WOLFSSL_API long wolfSSL_CTX_set_tlsext_status_arg(
    WOLFSSL_CTX * ,
    void * arg
)
```

This function sets the options argument to use with OCSP.

Parameters:

- **ctx** WOLFSSL_CTX structure to set user argument.
- **arg** user argument.

See:

- [wolfSSL_CTX_new](#)
- [wolfSSL_CTX_free](#)

Return:

- SSL_FAILURE If ctx or it's cert manager is NULL.
- SSL_SUCCESS If successfully set.

Example

```
WOLFSSL_CTX* ctx;
void* data;
int ret;
// setup ctx
ret = wolfSSL_CTX_set_tlsext_status_arg(ctx, data);
//check ret value
```

17.6.2.36 function `wolfSSL_CTX_set_tlsext_opaque_prf_input_callback_arg`

```
WOLFSSL_API long wolfSSL_CTX_set_tlsext_opaque_prf_input_callback_arg(
    WOLFSSL_CTX * ,
    void * arg
)
```

This function sets the optional argument to be passed to the PRF callback.

Parameters:

- **ctx** WOLFSSL_CTX structure to set user argument.
- **arg** user argument.

See:

- [wolfSSL_CTX_new](#)
- [wolfSSL_CTX_free](#)

Return:

- SSL_FAILURE If ctx is NULL.
- SSL_SUCCESS If successfully set.

Example

```
WOLFSSL_CTX* ctx;
void* data;
int ret;
// setup ctx
ret = wolfSSL_CTX_set_tlsext_opaques_prf_input_callback_arg(ctx, data);
//check ret value
```

17.6.2.37 function wolfSSL_set_options

```
WOLFSSL_API long wolfSSL_set_options(
    WOLFSSL * s,
    long op
)
```

This function sets the options mask in the ssl. Some valid options are, SSL_OP_ALL, SSL_OP_COOKIE_EXCHANGE, SSL_OP_NO_SSLv2, SSL_OP_NO_SSLv3, SSL_OP_NO_TLSv1, SSL_OP_NO_TLSv1_1, SSL_OP_NO_TLSv1_2, SSL_OP_NO_COMPRESSION.

Parameters:

- **s** WOLFSSL structure to set options mask.
- **op** This function sets the options mask in the ssl. Some valid options are: SSL_OP_ALL SSL_OP_COOKIE_EXCHANGE SSL_OP_NO_SSLv2 SSL_OP_NO_SSLv3 SSL_OP_NO_TLSv1 SSL_OP_NO_TLSv1_1 SSL_OP_NO_TLSv1_2 SSL_OP_NO_COMPRESSION

See:

- [wolfSSL_new](#)
- [wolfSSL_free](#)
- [wolfSSL_get_options](#)

Return: val Returns the updated options mask value stored in ssl.

Example

```
WOLFSSL* ssl;
unsigned long mask;
mask = SSL_OP_NO_TLSv1
mask = wolfSSL_set_options(ssl, mask);
// check mask
```

17.6.2.38 function wolfSSL_get_options

```
WOLFSSL_API long wolfSSL_get_options(  
    const WOLFSSL * s  
)
```

This function returns the current options mask.

Parameters:

- **ssl** WOLFSSL structure to get options mask from.

See:

- [wolfSSL_new](#)
- [wolfSSL_free](#)
- [wolfSSL_set_options](#)

Return: val Returns the mask value stored in ssl.

Example

```
WOLFSSL* ssl;  
unsigned long mask;  
mask = wolfSSL_get_options(ssl);  
// check mask
```

17.6.2.39 function wolfSSL_set_tlsext_debug_arg

```
WOLFSSL_API long wolfSSL_set_tlsext_debug_arg(  
    WOLFSSL * s,  
    void * arg  
)
```

This is used to set the debug argument passed around.

Parameters:

- **ssl** WOLFSSL structure to set argument in.
- **arg** argument to use.

See:

- [wolfSSL_new](#)
- [wolfSSL_free](#)

Return:

- SSL_SUCCESS On successful setting argument.
- SSL_FAILURE If an NULL ssl passed in.

Example

```
WOLFSSL* ssl;  
void* args;  
int ret;  
// create ssl object  
ret = wolfSSL_set_tlsext_debug_arg(ssl, args);  
// check ret value
```

17.6.2.40 function wolfSSL_get_verify_result

```
WOLFSSL_API long wolfSSL_get_verify_result(  
    const WOLFSSL * ssl  
)
```

This is used to get the results after trying to verify the peer's certificate.

Parameters:

- **ssl** WOLFSSL structure to get verification results from.

See:

- [wolfSSL_new](#)
- [wolfSSL_free](#)

Return:

- X509_V_OK On successful verification.
- SSL_FAILURE If an NULL ssl passed in.

Example

```
WOLFSSL* ssl;  
long ret;  
// attempt/complete handshake  
ret = wolfSSL_get_verify_result(ssl);  
// check ret value
```

17.6.2.41 function wolfSSL_CTX_allow_anon_cipher

```
WOLFSSL_API int wolfSSL_CTX_allow_anon_cipher(  
    WOLFSSL_CTX *  
)
```

This function enables the havAnon member of the CTX structure if HAVE_ANON is defined during compilation.

Parameters:

- **ctx** a pointer to a WOLFSSL_CTX structure, created using [wolfSSL_CTX_new\(\)](#).

See: none

Return:

- SSL_SUCCESS returned if the function executed successfully and the haveAnon member of the CTX is set to 1.
- SSL_FAILURE returned if the CTX structure was NULL.

Example

```
WOLFSSL_CTX* ctx = wolfSSL_CTX_new( protocol method );  
WOLFSSL* ssl = wolfSSL_new(ctx);  
...  
#ifdef HAVE_ANON  
if(cipherList == NULL){  
    wolfSSL_CTX_allow_anon_cipher(ctx);  
    if(wolfSSL_CTX_set_cipher_list(ctx, "ADH_AES128_SHA") != SSL_SUCCESS){  
        // failure case  
    }  
}
```

```
}  
#endif
```

17.6.2.42 function `wolfSSLv23_server_method`

```
WOLFSSL_API WOLFSSL_METHOD * wolfSSLv23_server_method(  
    void  
)
```

The `wolfSSLv23_server_method()` function is used to indicate that the application is a server and will support clients connecting with protocol version from SSL 3.0 - TLS 1.3. This function allocates memory for and initializes a new `WOLFSSL_METHOD` structure to be used when creating the SSL/TLS context with `wolfSSL_CTX_new()`.

Parameters:

- **none** No parameters

See:

- `wolfSSLv3_server_method`
- `wolfTLSv1_server_method`
- `wolfTLSv1_1_server_method`
- `wolfTLSv1_2_server_method`
- `wolfTLSv1_3_server_method`
- `wolfDTLSv1_server_method`
- `wolfSSL_CTX_new`

Return:

- pointer If successful, the call will return a pointer to the newly created `WOLFSSL_METHOD` structure.
- Failure If memory allocation fails when calling `XMALLOC`, the failure value of the underlying `malloc()` implementation will be returned (typically `NULL` with `errno` will be set to `ENOMEM`).

Example

```
WOLFSSL_METHOD* method;  
WOLFSSL_CTX* ctx;  
  
method = wolfSSLv23_server_method();  
if (method == NULL) {  
    // unable to get method  
}  
  
ctx = wolfSSL_CTX_new(method);  
...
```

17.6.2.43 function `wolfSSL_state`

```
WOLFSSL_API int wolfSSL_state(  
    WOLFSSL * ssl  
)
```

This is used to get the internal error state of the `WOLFSSL` structure.

See:

- `wolfSSL_new`
- `wolfSSL_free`

Return:

- wolfssl_error returns ssl error state, usually a negative
- BAD_FUNC_ARG if ssl is NULL.
- ssl WOLFSSL structure to get state from.

Example

```
WOLFSSL* ssl;
int ret;
// create ssl object
ret = wolfSSL_state(ssl);
// check ret value
```

17.6.2.44 function wolfSSL_check_domain_name

```
WOLFSSL_API int wolfSSL_check_domain_name(
    WOLFSSL * ssl,
    const char * dn
)
```

wolfSSL by default checks the peer certificate for a valid date range and a verified signature. Calling this function before wolfSSL_connect() or wolfSSL_accept() will add a domain name check to the list of checks to perform. dn holds the domain name to check against the peer certificate when it's received.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using wolfSSL_new().
- **dn** domain name to check against the peer certificate when received.

See: none

Return:

- SSL_SUCCESS upon success.
- SSL_FAILURE will be returned if a memory error was encountered.

Example

```
int ret = 0;
WOLFSSL* ssl;
char* domain = (char*) "www.yassl.com";
...

ret = wolfSSL_check_domain_name(ssl, domain);
if (ret != SSL_SUCCESS) {
    // failed to enable domain name check
}
```

17.6.2.45 function wolfSSL_set_compression

```
WOLFSSL_API int wolfSSL_set_compression(
    WOLFSSL * ssl
)
```

Turns on the ability to use compression for the SSL connection. Both sides must have compression turned on otherwise compression will not be used. The zlib library performs the actual data compression. To compile into the library use -with-libz for the configure system and define HAVE_LIBZ otherwise. Keep in mind that while compressing data before sending decreases the actual size of the

messages being sent and received, the amount of data saved by compression usually takes longer in time to analyze than it does to send it raw on all but the slowest of networks.

Parameters:

- **ssl** pointer to the SSL session, created with `wolfSSL_new()`.

See: none

Return:

- `SSL_SUCCESS` upon success.
- `NOT_COMPILED_IN` will be returned if compression support wasn't built into the library.

Example

```
int ret = 0;
WOLFSSL* ssl = 0;
...
ret = wolfSSL_set_compression(ssl);
if (ret == SSL_SUCCESS) {
    // successfully enabled compression for SSL session
}
```

17.6.2.46 function `wolfSSL_set_timeout`

```
WOLFSSL_API int wolfSSL_set_timeout(
    WOLFSSL *,
    unsigned int
)
```

This function sets the SSL session timeout value in seconds.

Parameters:

- **ssl** pointer to the SSL object, created with `wolfSSL_new()`.
- **to** value, in seconds, used to set the SSL session timeout.

See:

- `wolfSSL_get_session`
- `wolfSSL_set_session`

Return:

- `SSL_SUCCESS` will be returned upon successfully setting the session.
- `BAD_FUNC_ARG` will be returned if `ssl` is `NULL`.

Example

```
int ret = 0;
WOLFSSL* ssl = 0;
...

ret = wolfSSL_set_timeout(ssl, 500);
if (ret != SSL_SUCCESS) {
    // failed to set session timeout value
}
...
```

17.6.2.47 function wolfSSL_CTX_set_timeout

```
WOLFSSL_API int wolfSSL_CTX_set_timeout(  
    WOLFSSL_CTX * ,  
    unsigned int  
)
```

This function sets the timeout value for SSL sessions, in seconds, for the specified SSL context.

Parameters:

- **ctx** pointer to the SSL context, created with [wolfSSL_CTX_new\(\)](#).
- **to** session timeout value in seconds.

See:

- [wolfSSL_flush_sessions](#)
- [wolfSSL_get_session](#)
- [wolfSSL_set_session](#)
- [wolfSSL_get_sessionID](#)
- [wolfSSL_CTX_set_session_cache_mode](#)

Return:

- the previous timeout value, if WOLFSSL_ERROR_CODE_OPENSSL is defined on success. If not defined, SSL_SUCCESS will be returned.
- BAD_FUNC_ARG will be returned when the input context (ctx) is null.

Example

```
WOLFSSL_CTX*    ctx    = 0;  
...  
ret = wolfSSL_CTX_set_timeout(ctx, 500);  
if (ret != SSL_SUCCESS) {  
    // failed to set session timeout value  
}
```

17.6.2.48 function wolfSSL_CTX_UnloadCAs

```
WOLFSSL_API int wolfSSL_CTX_UnloadCAs(  
    WOLFSSL_CTX *  
)
```

This function unloads the CA signer list and frees the whole signer table.

Parameters:

- **ctx** a pointer to a WOLFSSL_CTX structure, created using [wolfSSL_CTX_new\(\)](#).

See:

- [wolfSSL_CertManagerUnloadCAs](#)
- LockMutex
- FreeSignerTable
- UnlockMutex

Return:

- SSL_SUCCESS returned on successful execution of the function.
- BAD_FUNC_ARG returned if the WOLFSSL_CTX struct is NULL or there are otherwise unpermitted argument values passed in a subroutine.
- BAD_MUTEX_E returned if there was a mutex error. The LockMutex() did not return 0.

Example

```
WOLFSSL_METHOD method = wolfTLSv1_2_client_method();
WOLFSSL_CTX* ctx = WOLFSSL_CTX_new(method);
...
if(!wolfSSL_CTX_UnloadCAs(ctx)){
    // The function did not unload CAs
}
```

17.6.2.49 function wolfSSL_CTX_Unload_trust_peers

```
WOLFSSL_API int wolfSSL_CTX_Unload_trust_peers(
    WOLFSSL_CTX *
```

This function is used to unload all previously loaded trusted peer certificates. Feature is enabled by defining the macro WOLFSSL_TRUST_PEER_CERT.

Parameters:

- **ctx** pointer to the SSL context, created with `wolfSSL_CTX_new()`.

See:

- `wolfSSL_CTX_trust_peer_buffer`
- `wolfSSL_CTX_trust_peer_cert`

Return:

- SSL_SUCCESS upon success.
- BAD_FUNC_ARG will be returned if ctx is NULL.
- SSL_BAD_FILE will be returned if the file doesn't exist, can't be read, or is corrupted.
- MEMORY_E will be returned if an out of memory condition occurs.

Example

```
int ret = 0;
WOLFSSL_CTX* ctx;
...
ret = wolfSSL_CTX_Unload_trust_peers(ctx);
if (ret != SSL_SUCCESS) {
    // error unloading trusted peer certs
}
...
```

17.6.2.50 function wolfSSL_CTX_trust_peer_buffer

```
WOLFSSL_API int wolfSSL_CTX_trust_peer_buffer(
    WOLFSSL_CTX *,
    const unsigned char *,
    long ,
    int
)
```

This function loads a certificate to use for verifying a peer when performing a TLS/SSL handshake. The peer certificate sent during the handshake is compared by using the SKID when available and the signature. If these two things do not match then any loaded CAs are used. Is the same functionality as `wolfSSL_CTX_trust_peer_cert` except is from a buffer instead of a file. Feature is enabled by defining the macro WOLFSSL_TRUST_PEER_CERT Please see the examples for proper usage.

Parameters:

- **ctx** pointer to the SSL context, created with `wolfSSL_CTX_new()`.
- **buffer** pointer to the buffer containing certificates.
- **sz** length of the buffer input.
- **type** type of certificate being loaded i.e. `SSL_FILETYPE_ASN1` or `SSL_FILETYPE_PEM`.

See:

- `wolfSSL_CTX_load_verify_buffer`
- `wolfSSL_CTX_use_certificate_file`
- `wolfSSL_CTX_use_PrivateKey_file`
- `wolfSSL_CTX_use_certificate_chain_file`
- `wolfSSL_CTX_trust_peer_cert`
- `wolfSSL_CTX_Unload_trust_peers`
- `wolfSSL_use_certificate_file`
- `wolfSSL_use_PrivateKey_file`
- `wolfSSL_use_certificate_chain_file`

Return:

- `SSL_SUCCESS` upon success
- `SSL_FAILURE` will be returned if ctx is NULL, or if both file and type are invalid.
- `SSL_BAD_FILETYPE` will be returned if the file is the wrong format.
- `SSL_BAD_FILE` will be returned if the file doesn't exist, can't be read, or is corrupted.
- `MEMORY_E` will be returned if an out of memory condition occurs.
- `ASN_INPUT_E` will be returned if Base16 decoding fails on the file.

Example

```
int ret = 0;
WOLFSSL_CTX* ctx;
...

ret = wolfSSL_CTX_trust_peer_buffer(ctx, bufferPtr, bufferSz,
SSL_FILETYPE_PEM);
if (ret != SSL_SUCCESS) {
// error loading trusted peer cert
}
...
```

17.6.2.51 function wolfSSL_CTX_set_group_messages

```
WOLFSSL_API int wolfSSL_CTX_set_group_messages(
    WOLFSSL_CTX *
```

)

This function turns on grouping of handshake messages where possible.

Parameters:

- **ctx** pointer to the SSL context, created with `wolfSSL_CTX_new()`.

See:

- `wolfSSL_set_group_messages`
- `wolfSSL_CTX_new`

Return:

- `SSL_SUCCESS` will be returned upon success.

- BAD_FUNC_ARG will be returned if the input context is null.

Example

```
WOLFSSL_CTX* ctx = 0;
...
ret = wolfSSL_CTX_set_group_messages(ctx);
if (ret != SSL_SUCCESS) {
    // failed to set handshake message grouping
}
```

17.6.2.52 function wolfSSL_set_group_messages

```
WOLFSSL_API int wolfSSL_set_group_messages(
    WOLFSSL *
```

This function turns on grouping of handshake messages where possible.

Parameters:

- **ssl** pointer to the SSL session, created with [wolfSSL_new\(\)](#).

See:

- [wolfSSL_CTX_set_group_messages](#)
- [wolfSSL_new](#)

Return:

- SSL_SUCCESS will be returned upon success.
- BAD_FUNC_ARG will be returned if the input context is null.

Example

```
WOLFSSL* ssl = 0;
...
ret = wolfSSL_set_group_messages(ssl);
if (ret != SSL_SUCCESS) {
    // failed to set handshake message grouping
}
```

17.6.2.53 function wolfSSL_CTX_SetMinVersion

```
WOLFSSL_API int wolfSSL_CTX_SetMinVersion(
    WOLFSSL_CTX * ctx,
    int version
)
```

This function sets the minimum downgrade version allowed. Applicable only when the connection allows downgrade using (wolfSSLv23_client_method or wolfSSLv23_server_method).

Parameters:

- **ctx** a pointer to a WOLFSSL_CTX structure, created using [wolfSSL_CTX_new\(\)](#).
- **version** an integer representation of the version to be set as the minimum: WOLFSSL_SSLV3 = 0, WOLFSSL_TLSV1 = 1, WOLFSSL_TLSV1_1 = 2 or WOLFSSL_TLSV1_2 = 3.

See: SetMinVersionHelper

Return:

- SSL_SUCCESS returned if the function returned without error and the minimum version is set.

- BAD_FUNC_ARG returned if the WOLFSSL_CTX structure was NULL or if the minimum version is not supported.

Example

```
WOLFSSL_CTX* ctx = WOLFSSL_CTX_new( protocol method );
WOLFSSL* ssl = WOLFSSL_new(ctx);
int version; // macrop representation
...
if(wolfSSL_CTX_SetMinVersion(ssl->ctx, version) != SSL_SUCCESS){
    // Failed to set min version
}
```

17.6.2.54 function wolfSSL_SetVersion

```
WOLFSSL_API int wolfSSL_SetVersion(
    WOLFSSL * ssl,
    int version
)
```

This function sets the SSL/TLS protocol version for the specified SSL session (WOLFSSL object) using the version as specified by version. This will override the protocol setting for the SSL session (ssl) - originally defined and set by the SSL context ([wolfSSL_CTX_new\(\)](#)) method type.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using [wolfSSL_new\(\)](#).
- **version** SSL/TLS protocol version. Possible values include WOLFSSL_SSLV3, WOLFSSL_TLSV1, WOLFSSL_TLSV1_1, WOLFSSL_TLSV1_2.

See: [wolfSSL_CTX_new](#)

Return:

- SSL_SUCCESS upon success.
- BAD_FUNC_ARG will be returned if the input SSL object is NULL or an incorrect protocol version is given for version.

Example

```
int ret = 0;
WOLFSSL* ssl;
...

ret = wolfSSL_SetVersion(ssl, WOLFSSL_TLSV1);
if (ret != SSL_SUCCESS) {
    // failed to set SSL session protocol version
}
```

17.6.2.55 function wolfSSL_UseALPN

```
WOLFSSL_API int wolfSSL_UseALPN(
    WOLFSSL * ssl,
    char * protocol_name_list,
    unsigned int protocol_name_listSz,
    unsigned char options
)
```

Setup ALPN use for a wolfSSL session.

Parameters:

- **ssl** The wolfSSL session to use.
- **protocol_name_list** List of protocol names to use. Comma delimited string is required.
- **protocol_name_listSz** Size of the list of protocol names.
- **options** WOLFSSL_ALPN_CONTINUE_ON_MISMATCH or WOLFSSL_ALPN_FAILED_ON_MISMATCH.

See: TLSX_UseALPN

Return:

- WOLFSSL_SUCCESS: upon success.
- BAD_FUNC_ARG Returned if ssl or protocol_name_list is null or protocol_name_listSz is too large or options contain something not supported.
- MEMORY_ERROR Error allocating memory for protocol list.
- SSL_FAILURE upon failure.

Example

```
wolfSSL_Init();
WOLFSSL_CTX* ctx;
WOLFSSL* ssl;
WOLFSSL_METHOD method = // Some wolfSSL method
ctx = wolfSSL_CTX_new(method);
ssl = wolfSSL_new(ctx);

char alpn_list[] = {};

if (wolfSSL_UseALPN(ssl, alpn_list, sizeof(alpn_list),
    WOLFSSL_ALPN_FAILED_ON_MISMATCH) != WOLFSSL_SUCCESS)
{
    // Error setting session ticket
}
```

17.6.2.56 function wolfSSL_CTX_UseSessionTicket

```
WOLFSSL_API int wolfSSL_CTX_UseSessionTicket(
    WOLFSSL_CTX * ctx
)
```

This function sets wolfSSL context to use a session ticket.

Parameters:

- **ctx** The WOLFSSL_CTX structure to use.

See: TLSX_UseSessionTicket

Return:

- SSL_SUCCESS Function executed successfully.
- BAD_FUNC_ARG Returned if ctx is null.
- MEMORY_E Error allocating memory in internal function.

Example

```
wolfSSL_Init();
WOLFSSL_CTX* ctx;
WOLFSSL_METHOD method = // Some wolfSSL method ;
ctx = wolfSSL_CTX_new(method);
```

```

if(wolfSSL_CTX_UseSessionTicket(ctx) != SSL_SUCCESS)
{
    // Error setting session ticket
}

```

17.6.2.57 function wolfSSL_check_private_key

```

WOLFSSL_API int wolfSSL_check_private_key(
    const WOLFSSL * ssl
)

```

This function checks that the private key is a match with the certificate being used.

Parameters:

- **ssl** WOLFSSL structure to check.

See:

- [wolfSSL_new](#)
- [wolfSSL_free](#)

Return:

- SSL_SUCCESS On successfully match.
- SSL_FAILURE If an error case was encountered.
- <0 All error cases other than SSL_FAILURE are negative values.

Example

```

WOLFSSL* ssl;
int ret;
// create and set up ssl
ret = wolfSSL_check_private_key(ssl);
// check ret value

```

17.6.2.58 function wolfSSL_use_certificate

```

WOLFSSL_API int wolfSSL_use_certificate(
    WOLFSSL * ssl,
    WOLFSSL_X509 * x509
)

```

this is used to set the certificate for WOLFSSL structure to use during a handshake.

Parameters:

- **ssl** WOLFSSL structure to set certificate in.
- **x509** certificate to use.

See:

- [wolfSSL_new](#)
- [wolfSSL_free](#)

Return:

- SSL_SUCCESS On successful setting argument.
- SSL_FAILURE If a NULL argument passed in.

Example

```

WOLFSSL* ssl;
WOLFSSL_X509* x509
int ret;
// create ssl object and x509
ret = wolfSSL_use_certificate(ssl, x509);
// check ret value

```

17.6.2.59 function wolfSSL_use_certificate_ASN1

```

WOLFSSL_API int wolfSSL_use_certificate_ASN1(
    WOLFSSL * ssl,
    unsigned char * der,
    int derSz
)

```

This is used to set the certificate for WOLFSSL structure to use during a handshake. A DER formatted buffer is expected.

Parameters:

- **ssl** WOLFSSL structure to set certificate in.
- **der** DER certificate to use.
- **derSz** size of the DER buffer passed in.

See:

- [wolfSSL_new](#)
- [wolfSSL_free](#)

Return:

- SSL_SUCCESS On successful setting argument.
- SSL_FAILURE If a NULL argument passed in.

Example

```

WOLFSSL* ssl;
unsigned char* der;
int derSz;
int ret;
// create ssl object and set DER variables
ret = wolfSSL_use_certificate_ASN1(ssl, der, derSz);
// check ret value

```

17.6.2.60 function wolfSSL_SESSION_get_master_key

```

WOLFSSL_API int wolfSSL_SESSION_get_master_key(
    const WOLFSSL_SESSION * ses,
    unsigned char * out,
    int outSz
)

```

This is used to get the master key after completing a handshake.

Parameters:

- **ses** WOLFSSL_SESSION structure to get master secret buffer from.
- **out** buffer to hold data.
- **outSz** size of out buffer passed in. (if 0 function will return max buffer size needed)

See:

- [wolfSSL_new](#)
- [wolfSSL_free](#)

Return:

- 0 On successfully getting data returns a value greater than 0
- 0 If no random data buffer or an error state returns 0
- max If outSz passed in is 0 then the maximum buffer size needed is returned

Example

```
WOLFSSL_SESSION ssl;
unsigned char* buffer;
size_t bufferSz;
size_t ret;
// complete handshake and get session structure
bufferSz = wolfSSL_SESSION_get_master_secret(ses, NULL, 0);
buffer = malloc(bufferSz);
ret = wolfSSL_SESSION_get_master_secret(ses, buffer, bufferSz);
// check ret value
```

17.6.2.61 function wolfSSL_SESSION_get_master_key_length

```
WOLFSSL_API int wolfSSL_SESSION_get_master_key_length(
    const WOLFSSL_SESSION * ses
)
```

This is used to get the master secret key length.

Parameters:

- **ses** WOLFSSL_SESSION structure to get master secret buffer from.

See:

- [wolfSSL_new](#)
- [wolfSSL_free](#)

Return: size Returns master secret key size.

Example

```
WOLFSSL_SESSION ssl;
unsigned char* buffer;
size_t bufferSz;
size_t ret;
// complete handshake and get session structure
bufferSz = wolfSSL_SESSION_get_master_secret_length(ses);
buffer = malloc(bufferSz);
// check ret value
```

17.6.2.62 function wolfSSL_CTX_set_cert_store

```
WOLFSSL_API void wolfSSL_CTX_set_cert_store(
    WOLFSSL_CTX * ctx,
    WOLFSSL_X509_STORE * str
)
```

This is a setter function for the WOLFSSL_X509_STORE structure in ctx.

Parameters:

- **ctx** pointer to the WOLFSSL_CTX structure for setting cert store pointer.
- **str** pointer to the WOLFSSL_X509_STORE to set in ctx.

See:

- [wolfSSL_CTX_new](#)
- [wolfSSL_CTX_free](#)

Return: none No return.

Example

```
WOLFSSL_CTX ctx;
WOLFSSL_X509_STORE* st;
// setup ctx and st
st = wolfSSL_CTX_set_cert_store(ctx, st);
//use st
```

17.6.2.63 function wolfSSL_CTX_get_cert_store

```
WOLFSSL_API WOLFSSL_X509_STORE * wolfSSL_CTX_get_cert_store(
    WOLFSSL_CTX * ctx
)
```

This is a getter function for the WOLFSSL_X509_STORE structure in ctx.

Parameters:

- **ctx** pointer to the WOLFSSL_CTX structure for getting cert store pointer.

See:

- [wolfSSL_CTX_new](#)
- [wolfSSL_CTX_free](#)
- [wolfSSL_CTX_set_cert_store](#)

Return:

- WOLFSSL_X509_STORE* On successfully getting the pointer.
- NULL Returned if NULL arguments are passed in.

Example

```
WOLFSSL_CTX ctx;
WOLFSSL_X509_STORE* st;
// setup ctx
st = wolfSSL_CTX_get_cert_store(ctx);
//use st
```

17.6.2.64 function wolfSSL_get_server_random

```
WOLFSSL_API size_t wolfSSL_get_server_random(
    const WOLFSSL * ssl,
    unsigned char * out,
    size_t outlen
)
```

This is used to get the random data sent by the server during the handshake.

Parameters:

- **ssl** WOLFSSL structure to get clients random data buffer from.
- **out** buffer to hold random data.
- **outSz** size of out buffer passed in. (if 0 function will return max buffer size needed)

See:

- [wolfSSL_new](#)
- [wolfSSL_free](#)

Return:

- 0 On successfully getting data returns a value greater than 0
- 0 If no random data buffer or an error state returns 0
- max If outSz passed in is 0 then the maximum buffer size needed is returned

Example

```
WOLFSSL ssl;
unsigned char* buffer;
size_t bufferSz;
size_t ret;
bufferSz = wolfSSL_get_server_random(ssl, NULL, 0);
buffer = malloc(bufferSz);
ret = wolfSSL_get_server_random(ssl, buffer, bufferSz);
// check ret value
```

17.6.2.65 function wolfSSL_get_client_random

```
WOLFSSL_API size_t wolfSSL_get_client_random(
    const WOLFSSL * ssl,
    unsigned char * out,
    size_t outSz
)
```

This is used to get the random data sent by the client during the handshake.

Parameters:

- **ssl** WOLFSSL structure to get clients random data buffer from.
- **out** buffer to hold random data.
- **outSz** size of out buffer passed in. (if 0 function will return max buffer size needed)

See:

- [wolfSSL_new](#)
- [wolfSSL_free](#)

Return:

- 0 On successfully getting data returns a value greater than 0
- 0 If no random data buffer or an error state returns 0
- max If outSz passed in is 0 then the maximum buffer size needed is returned

Example

```

WOLFSSL ssl;
unsigned char* buffer;
size_t bufferSz;
size_t ret;
bufferSz = wolfSSL_get_client_random(ssl, NULL, 0);
buffer = malloc(bufferSz);
ret = wolfSSL_get_client_random(ssl, buffer, bufferSz);
// check ret value

```

17.6.2.66 function wolfSSL_CTX_get_default_passwd_cb

```

WOLFSSL_API wc_pem_password_cb * wolfSSL_CTX_get_default_passwd_cb(
    WOLFSSL_CTX * ctx
)

```

This is a getter function for the password callback set in ctx.

Parameters:

- **ctx** WOLFSSL_CTX structure to get call back from.

See:

- [wolfSSL_CTX_new](#)
- [wolfSSL_CTX_free](#)

Return:

- func On success returns the callback function.
- NULL If ctx is NULL then NULL is returned.

Example

```

WOLFSSL_CTX* ctx;
wc_pem_password_cb cb;
// setup ctx
cb = wolfSSL_CTX_get_default_passwd_cb(ctx);
//use cb

```

17.6.2.67 function wolfSSL_CTX_get_default_passwd_cb_userdata

```

WOLFSSL_API void * wolfSSL_CTX_get_default_passwd_cb_userdata(
    WOLFSSL_CTX * ctx
)

```

This is a getter function for the password callback user data set in ctx.

Parameters:

- **ctx** WOLFSSL_CTX structure to get user data from.

See:

- [wolfSSL_CTX_new](#)
- [wolfSSL_CTX_free](#)

Return:

- pointer On success returns the user data pointer.
- NULL If ctx is NULL then NULL is returned.

Example

```
WOLFSSL_CTX* ctx;
void* data;
// setup ctx
data = wolfSSL_CTX_get_default_passwd_cb(ctx);
//use data
```

17.6.2.68 function `wolfSSL_CTX_clear_options`

```
WOLFSSL_API long wolfSSL_CTX_clear_options(
    WOLFSSL_CTX *,
    long
)
```

This function resets option bits of WOLFSSL_CTX object.

Parameters:

- **ctx** pointer to the SSL context.

See:

- `wolfSSL_CTX_new`
- `wolfSSL_new`
- `wolfSSL_free`

Return: option new option bits

Example

```
WOLFSSL_CTX* ctx = 0;
...
wolfSSL_CTX_clear_options(ctx, SSL_OP_NO_TLSv1);
```

17.6.2.69 function `wolfSSL_set_msg_callback`

```
WOLFSSL_API int wolfSSL_set_msg_callback(
    WOLFSSL * ssl,
    SSL_Msg_Cb cb
)
```

This function sets a callback in the ssl. The callback is to observe handshake messages. NULL value of cb resets the callback.

Parameters:

- **ssl** WOLFSSL structure to set callback argument.

See: `wolfSSL_set_msg_callback_arg`

Return:

- `SSL_SUCCESS` On success.
- `SSL_FAILURE` If an NULL ssl passed in.

Example

```
static cb(int write_p, int version, int content_type,
const void *buf, size_t len, WOLFSSL *ssl, void *arg)
...
WOLFSSL* ssl;
ret = wolfSSL_set_msg_callback(ssl, cb);
// check ret
```

17.6.2.70 function `wolfSSL_set_msg_callback_arg`

```
WOLFSSL_API int wolfSSL_set_msg_callback_arg(  
    WOLFSSL * ssl,  
    void * arg  
)
```

This function sets associated callback context value in the ssl. The value is handed over to the callback argument.

Parameters:

- **ssl** WOLFSSL structure to set callback argument.

See: `wolfSSL_set_msg_callback`

Return: none No return.

Example

```
static cb(int write_p, int version, int content_type,  
const void *buf, size_t len, WOLFSSL *ssl, void *arg)  
...  
WOLFSSL* ssl;  
ret = wolfSSL_set_msg_callback(ssl, cb);  
// check ret  
wolfSSL_set_msg_callback(ssl, arg);
```

17.6.2.71 function `wolfSSL_send_hrr_cookie`

```
WOLFSSL_API int wolfSSL_send_hrr_cookie(  
    WOLFSSL * ssl,  
    const unsigned char * secret,  
    unsigned int secretSz  
)
```

This function is called on the server side to indicate that a HelloRetryRequest message must contain a Cookie. The Cookie holds a hash of the current transcript so that another server process can handle the ClientHello in reply. The secret is used when generating the integrity check on the Cookie data.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using `wolfSSL_new()`.
- **secret** a pointer to a buffer holding the secret. Passing NULL indicates to generate a new random secret.
- **secretSz** Size of the secret in bytes. Passing 0 indicates to use the default size: `WC_SHA256_DIGEST_SIZE` (or `WC_SHA_DIGEST_SIZE` when SHA-256 not available).

See: `wolfSSL_new`

Return:

- `BAD_FUNC_ARG` if ssl is NULL or not using TLS v1.3.
- `SIDE_ERROR` if called with a client.
- `WOLFSSL_SUCCESS` if succesful.
- `MEMORY_ERROR` if allocating dynamic memory for storing secret failed.
- Another -ve value on internal error.

Example

```
int ret;  
WOLFSSL* ssl;
```

```

char secret[32];
...
ret = wolfSSL__send_hrr_cookie(ssl, secret, sizeof(secret));
if (ret != WOLFSSL_SUCCESS) {
    // failed to set use of Cookie and secret
}

```

17.6.2.72 function wolfSSL_CTX_no_ticket_TLSv13

```

WOLFSSL_API int wolfSSL_CTX_no_ticket_TLSv13(
    WOLFSSL_CTX * ctx
)

```

This function is called on the server to stop it from sending a resumption session ticket once the handshake is complete.

Parameters:

- **ctx** a pointer to a WOLFSSL_CTX structure, created with [wolfSSL_CTX_new\(\)](#).

See: [wolfSSL_no_ticket_TLSv13](#)

Return:

- BAD_FUNC_ARG if ctx is NULL or not using TLS v1.3.
- SIDE_ERROR if called with a client.
- 0 if successful.

Example

```

int ret;
WOLFSSL_CTX* ctx;
...
ret = wolfSSL_CTX_no_ticket_TLSv13(ctx);
if (ret != 0) {
    // failed to set no ticket
}

```

17.6.2.73 function wolfSSL_no_ticket_TLSv13

```

WOLFSSL_API int wolfSSL_no_ticket_TLSv13(
    WOLFSSL * ssl
)

```

This function is called on the server to stop it from sending a resumption session ticket once the handshake is complete.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using [wolfSSL_new\(\)](#).

See: [wolfSSL_CTX_no_ticket_TLSv13](#)

Return:

- BAD_FUNC_ARG if ssl is NULL or not using TLS v1.3.
- SIDE_ERROR if called with a client.
- 0 if successful.

Example

```

int ret;
WOLFSSL* ssl;
...
ret = wolfSSL_no_ticket_TLsv13(ssl);
if (ret != 0) {
    // failed to set no ticket
}

```

17.6.2.74 function wolfSSL_CTX_no_dhe_psk

```

WOLFSSL_API int wolfSSL_CTX_no_dhe_psk(
    WOLFSSL_CTX * ctx
)

```

This function is called on a TLS v1.3 wolfSSL context to disallow Diffie-Hellman (DH) style key exchanges when handshakes are using pre-shared keys for authentication.

Parameters:

- **ctx** a pointer to a WOLFSSL_CTX structure, created with [wolfSSL_CTX_new\(\)](#).

See: [wolfSSL_no_dhe_psk](#)

Return:

- BAD_FUNC_ARG if ctx is NULL or not using TLS v1.3.
- 0 if successful.

Example

```

int ret;
WOLFSSL_CTX* ctx;
...
ret = wolfSSL_CTX_no_dhe_psk(ctx);
if (ret != 0) {
    // failed to set no DHE for PSK handshakes
}

```

17.6.2.75 function wolfSSL_no_dhe_psk

```

WOLFSSL_API int wolfSSL_no_dhe_psk(
    WOLFSSL * ssl
)

```

This function is called on a TLS v1.3 client or server wolfSSL to disallow Diffie-Hellman (DH) style key exchanges when handshakes are using pre-shared keys for authentication.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using [wolfSSL_new\(\)](#).

See: [wolfSSL_CTX_no_dhe_psk](#)

Return:

- BAD_FUNC_ARG if ssl is NULL or not using TLS v1.3.
- 0 if successful.

Example

```

int ret;
WOLFSSL* ssl;

```

```

...
ret = wolfSSL_no_dhe_psk(ssl);
if (ret != 0) {
    // failed to set no DHE for PSK handshakes
}

```

17.6.2.76 function wolfSSL_CTX_allow_post_handshake_auth

```

WOLFSSL_API int wolfSSL_CTX_allow_post_handshake_auth(
    WOLFSSL_CTX * ctx
)

```

This function is called on a TLS v1.3 client wolfSSL context to allow a client certificate to be sent post handshake upon request from server. This is useful when connecting to a web server that has some pages that require client authentication and others that don't.

Parameters:

- **ctx** a pointer to a WOLFSSL_CTX structure, created with [wolfSSL_CTX_new\(\)](#).

See:

- [wolfSSL_allow_post_handshake_auth](#)
- [wolfSSL_request_certificate](#)

Return:

- BAD_FUNC_ARG if ctx is NULL or not using TLS v1.3.
- SIDE_ERROR if called with a server.
- 0 if successful.

Example

```

int ret;
WOLFSSL_CTX* ctx;
...
ret = wolfSSL_allow_post_handshake_auth(ctx);
if (ret != 0) {
    // failed to allow post handshake authentication
}

```

17.6.2.77 function wolfSSL_allow_post_handshake_auth

```

WOLFSSL_API int wolfSSL_allow_post_handshake_auth(
    WOLFSSL * ssl
)

```

This function is called on a TLS v1.3 client wolfSSL to allow a client certificate to be sent post handshake upon request from server. A Post-Handshake Client Authentication extension is sent in the ClientHello. This is useful when connecting to a web server that has some pages that require client authentication and others that don't.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using [wolfSSL_new\(\)](#).

See:

- [wolfSSL_CTX_allow_post_handshake_auth](#)
- [wolfSSL_request_certificate](#)

Return:

- BAD_FUNC_ARG if ssl is NULL or not using TLS v1.3.
- SIDE_ERROR if called with a server.
- 0 if successful.

Example

```
int ret;
WOLFSSL* ssl;
...
ret = wolfSSL_allow_post_handshake_auth(ssl);
if (ret != 0) {
    // failed to allow post handshake authentication
}
```

17.6.2.78 function wolfSSL_CTX_set1_groups_list

```
WOLFSSL_API int wolfSSL_CTX_set1_groups_list(
    WOLFSSL_CTX * ctx,
    char * list
)
```

This function sets the list of elliptic curve groups to allow on a wolfSSL context in order of preference. The list is a null-terminated text string, and a colon-delimited list. Call this function to set the key exchange elliptic curve parameters to use with the TLS v1.3 connections.

Parameters:

- **ctx** a pointer to a WOLFSSL_CTX structure, created with `wolfSSL_CTX_new()`.
- **list** a string that is a colon-delimited list of elliptic curve groups.

See:

- `wolfSSL_set1_groups_list`
- `wolfSSL_CTX_set_groups`
- `wolfSSL_set_groups`
- `wolfSSL_UseKeyShare`
- `wolfSSL_preferred_group`

Return:

- WOLFSSL_FAILURE if pointer parameters are NULL, there are more than WOLFSSL_MAX_GROUP_COUNT groups, a group name is not recognized or not using TLS v1.3.
- WOLFSSL_SUCCESS if successful.

Example

```
int ret;
WOLFSSL_CTX* ctx;
const char* list = "P-384:P-256";
...
ret = wolfSSL_CTX_set1_groups_list(ctx, list);
if (ret != WOLFSSL_SUCCESS) {
    // failed to set group list
}
```

17.6.2.79 function wolfSSL_set1_groups_list

```
WOLFSSL_API int wolfSSL_set1_groups_list(
    WOLFSSL * ssl,
    char * list
)
```

)

This function sets the list of elliptic curve groups to allow on a wolfSSL in order of preference. The list is a null-terminated text string, and a colon-delimited list. Call this function to set the key exchange elliptic curve parameters to use with the TLS v1.3 connections.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using `wolfSSL_new()`.
- **list** a string that is a colon separated list of key exchange groups.

See:

- `wolfSSL_CTX_set1_groups_list`
- `wolfSSL_CTX_set_groups`
- `wolfSSL_set_groups`
- `wolfSSL_UseKeyShare`
- `wolfSSL_preferred_group`

Return:

- WOLFSSL_FAILURE if pointer parameters are NULL, there are more than WOLFSSL_MAX_GROUP_COUNT groups, a group name is not recognized or not using TLS v1.3.
- WOLFSSL_SUCCESS if successful.

Example

```
int ret;
WOLFSSL* ssl;
const char* list = "P-384:P-256";
...
ret = wolfSSL_CTX_set1_groups_list(ssl, list);
if (ret != WOLFSSL_SUCCESS) {
    // failed to set group list
}
```

17.6.2.80 function `wolfSSL_CTX_set_groups`

```
WOLFSSL_API int wolfSSL_CTX_set_groups(
    WOLFSSL_CTX * ctx,
    int * groups,
    int count
)
```

This function sets the list of elliptic curve groups to allow on a wolfSSL context in order of preference. The list is an array of group identifiers with the number of identifiers specified in count. Call this function to set the key exchange elliptic curve parameters to use with the TLS v1.3 connections.

Parameters:

- **ctx** a pointer to a WOLFSSL_CTX structure, created with `wolfSSL_CTX_new()`.
- **groups** a list of key exchange groups by identifier.
- **count** the number of key exchange groups in groups.

See:

- `wolfSSL_set_groups`
- `wolfSSL_UseKeyShare`
- `wolfSSL_CTX_set_groups`
- `wolfSSL_set_groups`
- `wolfSSL_CTX_set1_groups_list`

- `wolfSSL_set1_groups_list`
- `wolfSSL_preferred_group`

Return:

- `BAD_FUNC_ARG` if a pointer parameter is null, the number of groups exceeds `WOLFSSL_MAX_GROUP_COUNT` or not using TLS v1.3.
- `WOLFSSL_SUCCESS` if successful.

Example

```
int ret;
WOLFSSL_CTX* ctx;
int* groups = { WOLFSSL_ECC_X25519, WOLFSSL_ECC_SECP256R1 };
int count = 2;
...
ret = wolfSSL_CTX_set1_groups_list(ctx, groups, count);
if (ret != WOLFSSL_SUCCESS) {
    // failed to set group list
}
```

17.6.2.81 function `wolfSSL_set_groups`

```
WOLFSSL_API int wolfSSL_set_groups(
    WOLFSSL * ssl,
    int * groups,
    int count
)
```

This function sets the list of elliptic curve groups to allow on a `wolfSSL`. The list is an array of group identifiers with the number of identifiers specified in `count`. Call this function to set the key exchange elliptic curve parameters to use with the TLS v1.3 connections.

Parameters:

- **ssl** a pointer to a `WOLFSSL` structure, created using `wolfSSL_new()`.
- **groups** a list of key exchange groups by identifier.
- **count** the number of key exchange groups in `groups`.

See:

- `wolfSSL_CTX_set_groups`
- `wolfSSL_UseKeyShare`
- `wolfSSL_CTX_set_groups`
- `wolfSSL_set_groups`
- `wolfSSL_CTX_set1_groups_list`
- `wolfSSL_set1_groups_list`
- `wolfSSL_preferred_group`

Return:

- `BAD_FUNC_ARG` if a pointer parameter is null, the number of groups exceeds `WOLFSSL_MAX_GROUP_COUNT`, any of the identifiers are unrecognized or not using TLS v1.3.
- `WOLFSSL_SUCCESS` if successful.

Example

```
int ret;
WOLFSSL* ssl;
int* groups = { WOLFSSL_ECC_X25519, WOLFSSL_ECC_SECP256R1 };
int count = 2;
```

```

...
ret = wolfSSL_set_groups(ssl, groups, count);
if (ret != WOLFSSL_SUCCESS) {
    // failed to set group list
}

```

17.6.2.82 function wolfSSL_CTX_set_max_early_data

```

WOLFSSL_API int wolfSSL_CTX_set_max_early_data(
    WOLFSSL_CTX * ctx,
    unsigned int sz
)

```

This function sets the maximum amount of early data that will be accepted by a TLS v1.3 server using the wolfSSL context. Call this function to limit the amount of early data to process to mitigate replay attacks. Early data is protected by keys derived from those of the connection that the session ticket was sent and therefore will be the same every time a session ticket is used in resumption. The value is included in the session ticket for resumption. A value of zero indicates no early data is to be sent by client using session tickets. It is recommended that the number of early data bytes be kept as low as practically possible in the application.

Parameters:

- **ctx** a pointer to a WOLFSSL_CTX structure, created with [wolfSSL_CTX_new\(\)](#).
- **sz** the amount of early data to accept in bytes.

See:

- [wolfSSL_set_max_early_data](#)
- [wolfSSL_write_early_data](#)
- [wolfSSL_read_early_data](#)

Return:

- BAD_FUNC_ARG if ctx is NULL or not using TLS v1.3.
- SIDE_ERROR if called with a client.
- 0 if successful.

Example

```

int ret;
WOLFSSL_CTX* ctx;
...
ret = wolfSSL_CTX_set_max_early_data(ctx, 128);
if (ret != WOLFSSL_SUCCESS) {
    // failed to set group list
}

```

17.6.2.83 function wolfSSL_set_max_early_data

```

WOLFSSL_API int wolfSSL_set_max_early_data(
    WOLFSSL * ssl,
    unsigned int sz
)

```

This function sets the maximum amount of early data that will be accepted by a TLS v1.3 server using the wolfSSL context. Call this function to limit the amount of early data to process to mitigate replay attacks. Early data is protected by keys derived from those of the connection that the session ticket was sent and therefore will be the same every time a session ticket is used in resumption. The value

is included in the session ticket for resumption. A value of zero indicates no early data is to be sent by client using session tickets. It is recommended that the number of early data bytes be kept as low as practically possible in the application.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using `wolfSSL_new()`.
- **sz** the amount of early data to accept from client in bytes.

See:

- `wolfSSL_CTX_set_max_early_data`
- `wolfSSL_write_early_data`
- `wolfSSL_read_early_data`

Return:

- BAD_FUNC_ARG if ssl is NULL or not using TLS v1.3.
- SIDE_ERROR if called with a client.
- 0 if successful.

Example

```
int ret;
WOLFSSL* ssl;
...
ret = wolfSSL_set_max_early_data(ssl, 128);
if (ret != WOLFSSL_SUCCESS) {
    // failed to set group list
}
```

17.6.2.84 function `wolfSSL_CTX_set_psk_client_tls13_callback`

```
WOLFSSL_API void wolfSSL_CTX_set_psk_client_tls13_callback(
    WOLFSSL_CTX * ctx,
    wc_psk_client_tls13_callback cb
)
```

This function sets the Pre-Shared Key (PSK) client side callback for TLS v1.3 connections. The callback is used to find a PSK identity and return its key and the name of the cipher to use for the handshake. The function sets the `client_psk_tls13_cb` member of the `WOLFSSL_CTX` structure.

Parameters:

- **ctx** a pointer to a `WOLFSSL_CTX` structure, created with `wolfSSL_CTX_new()`.
- **cb** a Pre-Shared Key (PSK) callback for a TLS 1.3 client.

See:

- `wolfSSL_set_psk_client_tls13_callback`
- `wolfSSL_CTX_set_psk_server_tls13_callback`
- `wolfSSL_set_psk_server_tls13_callback`

Example

```
WOLFSSL_CTX* ctx;
...
wolfSSL_CTX_set_psk_client_tls13_callback(ctx, my_psk_client_tls13_cb);
```

17.6.2.85 function `wolfSSL_set_psk_client_tls13_callback`

```
WOLFSSL_API void wolfSSL_set_psk_client_tls13_callback(  
    WOLFSSL * ssl,  
    wc_psk_client_tls13_callback cb  
)
```

This function sets the Pre-Shared Key (PSK) client side callback for TLS v1.3 connections. The callback is used to find a PSK identity and return its key and the name of the cipher to use for the handshake. The function sets the `client_psk_tls13_cb` member of the options field in WOLFSSL structure.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using `wolfSSL_new()`.
- **cb** a Pre-Shared Key (PSK) callback for a TLS 1.3 client.

See:

- `wolfSSL_CTX_set_psk_client_tls13_callback`
- `wolfSSL_CTX_set_psk_server_tls13_callback`
- `wolfSSL_set_psk_server_tls13_callback`

Example

```
WOLFSSL* ssl;  
...  
wolfSSL_set_psk_client_tls13_callback(ssl, my_psk_client_tls13_cb);
```

17.6.2.86 function `wolfSSL_CTX_set_psk_server_tls13_callback`

```
WOLFSSL_API void wolfSSL_CTX_set_psk_server_tls13_callback(  
    WOLFSSL_CTX * ctx,  
    wc_psk_server_tls13_callback cb  
)
```

This function sets the Pre-Shared Key (PSK) server side callback for TLS v1.3 connections. The callback is used to find a PSK identity and return its key and the name of the cipher to use for the handshake. The function sets the `server_psk_tls13_cb` member of the WOLFSSL_CTX structure.

Parameters:

- **ctx** a pointer to a WOLFSSL_CTX structure, created with `wolfSSL_CTX_new()`.
- **cb** a Pre-Shared Key (PSK) callback for a TLS 1.3 server.

See:

- `wolfSSL_CTX_set_psk_client_tls13_callback`
- `wolfSSL_set_psk_client_tls13_callback`
- `wolfSSL_set_psk_server_tls13_callback`

Example

```
WOLFSSL_CTX* ctx;  
...  
wolfSSL_CTX_set_psk_server_tls13_callback(ctx, my_psk_client_tls13_cb);
```

17.6.2.87 function `wolfSSL_set_psk_server_tls13_callback`

```
WOLFSSL_API void wolfSSL_set_psk_server_tls13_callback(  
    WOLFSSL * ssl,  
    wc_psk_server_tls13_callback cb  
)
```

This function sets the Pre-Shared Key (PSK) server side callback for TLS v1.3 connections. The callback is used to find a PSK identity and return its key and the name of the cipher to use for the handshake. The function sets the `server_psk_tls13_cb` member of the options field in WOLFSSL structure.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using `wolfSSL_new()`.
- **cb** a Pre-Shared Key (PSK) callback for a TLS 1.3 server.

See:

- `wolfSSL_CTX_set_psk_client_tls13_callback`
- `wolfSSL_set_psk_client_tls13_callback`
- `wolfSSL_CTX_set_psk_server_tls13_callback`

Example

```
WOLFSSL* ssl;
...
wolfSSL_set_psk_server_tls13_callback(ssl, my_psk_server_tls13_cb);
```

17.6.2.88 function `wolfSSL_UseKeyShare`

```
WOLFSSL_API int wolfSSL_UseKeyShare(
    WOLFSSL * ssl,
    word16 group
)
```

This function creates a key share entry from the group including generating a key pair. The KeyShare extension contains all the generated public keys for key exchange. If this function is called, then only the groups specified will be included. Call this function when a preferred group has been previously established for the server.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using `wolfSSL_new()`.
- **group** a key exchange group identifier.

See:

- `wolfSSL_preferred_group`
- `wolfSSL_CTX_set1_groups_list`
- `wolfSSL_set1_groups_list`
- `wolfSSL_CTX_set_groups`
- `wolfSSL_set_groups`
- `wolfSSL_NoKeyShares`

Return:

- `BAD_FUNC_ARG` if `ssl` is `NULL`.
- `MEMORY_E` when dynamic memory allocation fails.
- `WOLFSSL_SUCCESS` if successful.

Example

```
int ret;
WOLFSSL* ssl;
...
ret = wolfSSL_UseKeyShare(ssl, WOLFSSL_ECC_X25519);
if (ret != WOLFSSL_SUCCESS) {
    // failed to set key share
}
```

17.6.2.89 function wolfSSL_NoKeyShares

```
WOLFSSL_API int wolfSSL_NoKeyShares(  
    WOLFSSL * ssl  
)
```

This function is called to ensure no key shares are sent in the ClientHello. This will force the server to respond with a HelloRetryRequest if a key exchange is required in the handshake. Call this function when the expected key exchange group is not known and to avoid the generation of keys unnecessarily. Note that an extra round-trip will be required to complete the handshake when a key exchange is required.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using [wolfSSL_new\(\)](#).

See: [wolfSSL_UseKeyShare](#)

Return:

- BAD_FUNC_ARG if ssl is NULL.
- SIDE_ERROR if called with a server.
- WOLFSSL_SUCCESS if successful.

Example

```
int ret;  
WOLFSSL* ssl;  
...  
ret = wolfSSL_NoKeyShares(ssl);  
if (ret != WOLFSSL_SUCCESS) {  
    // failed to set no key shares  
}
```

17.6.2.90 function wolfTLSv1_3_server_method_ex

```
WOLFSSL_API WOLFSSL_METHOD * wolfTLSv1_3_server_method_ex(  
    void * heap  
)
```

This function is used to indicate that the application is a server and will only support the TLS 1.3 protocol. This function allocates memory for and initializes a new wolfSSL_METHOD structure to be used when creating the SSL/TLS context with [wolfSSL_CTX_new\(\)](#).

Parameters:

- **heap** a pointer to a buffer that the static memory allocator will use during dynamic memory allocation.

See:

- [wolfSSLv3_server_method](#)
- [wolfTLSv1_server_method](#)
- [wolfTLSv1_1_server_method](#)
- [wolfTLSv1_2_server_method](#)
- [wolfTLSv1_3_server_method](#)
- [wolfDTLSv1_server_method](#)
- [wolfSSLv23_server_method](#)
- [wolfSSL_CTX_new](#)

Return:

- If successful, the call will return a pointer to the newly created WOLFSSL_METHOD structure.
- FAIL If memory allocation fails when calling XMALLOC, the failure value of the underlying malloc() implementation will be returned (typically NULL with errno will be set to ENOMEM).

Example

```
#include <wolfssl/ssl.h>

WOLFSSL_METHOD* method;
WOLFSSL_CTX* ctx;

method = wolfTLSv1_3_server_method_ex(NULL);
if (method == NULL) {
    // unable to get method
}

ctx = wolfSSL_CTX_new(method);
...
```

17.6.2.91 function wolfTLSv1_3_client_method_ex

```
WOLFSSL_API WOLFSSL_METHOD * wolfTLSv1_3_client_method_ex(
    void * heap
)
```

This function is used to indicate that the application is a client and will only support the TLS 1.3 protocol. This function allocates memory for and initializes a new wolfSSL_METHOD structure to be used when creating the SSL/TLS context with [wolfSSL_CTX_new\(\)](#).

Parameters:

- **heap** a pointer to a buffer that the static memory allocator will use during dynamic memory allocation.

See:

- [wolfSSLv3_client_method](#)
- [wolfTLSv1_client_method](#)
- [wolfTLSv1_1_client_method](#)
- [wolfTLSv1_2_client_method](#)
- [wolfTLSv1_3_client_method](#)
- [wolfDTLSv1_client_method](#)
- [wolfSSLv23_client_method](#)
- [wolfSSL_CTX_new](#)

Return:

- If successful, the call will return a pointer to the newly created WOLFSSL_METHOD structure.
- FAIL If memory allocation fails when calling XMALLOC, the failure value of the underlying malloc() implementation will be returned (typically NULL with errno will be set to ENOMEM).

Example

```
#include <wolfssl/ssl.h>

WOLFSSL_METHOD* method;
WOLFSSL_CTX* ctx;

method = wolfTLSv1_3_client_method_ex(NULL);
if (method == NULL) {
```

```

    // unable to get method
}

ctx = wolfSSL_CTX_new(method);
...

```

17.6.2.92 function wolfTLSv1_3_server_method

```

WOLFSSL_API WOLFSSL_METHOD * wolfTLSv1_3_server_method(
    void
)

```

This function is used to indicate that the application is a server and will only support the TLS 1.3 protocol. This function allocates memory for and initializes a new `wolfSSL_METHOD` structure to be used when creating the SSL/TLS context with `wolfSSL_CTX_new()`.

See:

- `wolfSSLv3_server_method`
- `wolfTLSv1_server_method`
- `wolfTLSv1_1_server_method`
- `wolfTLSv1_2_server_method`
- `wolfTLSv1_3_server_method_ex`
- `wolfDTLSv1_server_method`
- `wolfSSLv23_server_method`
- `wolfSSL_CTX_new`

Return:

- If successful, the call will return a pointer to the newly created `WOLFSSL_METHOD` structure.
- FAIL If memory allocation fails when calling `XMALLOC`, the failure value of the underlying `malloc()` implementation will be returned (typically `NULL` with `errno` will be set to `ENOMEM`).

Example

```

#include <wolfssl/ssl.h>

WOLFSSL_METHOD* method;
WOLFSSL_CTX* ctx;

method = wolfTLSv1_3_server_method();
if (method == NULL) {
    // unable to get method
}

ctx = wolfSSL_CTX_new(method);
...

```

17.6.2.93 function wolfTLSv1_3_client_method

```

WOLFSSL_API WOLFSSL_METHOD * wolfTLSv1_3_client_method(
    void
)

```

This function is used to indicate that the application is a client and will only support the TLS 1.3 protocol. This function allocates memory for and initializes a new `wolfSSL_METHOD` structure to be used when creating the SSL/TLS context with `wolfSSL_CTX_new()`.

See:

- `wolfSSLv3_client_method`
- `wolfTLSv1_client_method`
- `wolfTLSv1_1_client_method`
- `wolfTLSv1_2_client_method`
- `wolfTLSv1_3_client_method_ex`
- `wolfDTLSv1_client_method`
- `wolfSSLv23_client_method`
- `wolfSSL_CTX_new`

Return:

- If successful, the call will return a pointer to the newly created WOLFSSL_METHOD structure.
- FAIL If memory allocation fails when calling XMALLOC, the failure value of the underlying malloc() implementation will be returned (typically NULL with errno will be set to ENOMEM).

Example

```
#include <wolfssl/ssl.h>
```

```
WOLFSSL_METHOD* method;
WOLFSSL_CTX* ctx;
```

```
method = wolfTLSv1_3_client_method();
if (method == NULL) {
    // unable to get method
}
```

```
ctx = wolfSSL_CTX_new(method);
...
```

17.6.2.94 function `wolfTLSv1_3_method_ex`

```
WOLFSSL_API WOLFSSL_METHOD * wolfTLSv1_3_method_ex(
    void * heap
)
```

This function returns a WOLFSSL_METHOD similar to `wolfTLSv1_3_client_method` except that it is not determined which side yet (server/client).

Parameters:

- **heap** a pointer to a buffer that the static memory allocator will use during dynamic memory allocation.

See:

- `wolfSSL_new`
- `wolfSSL_free`

Return:

- WOLFSSL_METHOD On successful creations returns a WOLFSSL_METHOD pointer
- NULL Null if memory allocation error or failure to create method

Example

```
WOLFSSL* ctx;
ctx = wolfSSL_CTX_new(wolfTLSv1_3_method_ex(NULL));
// check ret value
```

17.6.2.95 function wolfTLSv1_3_method

```
WOLFSSL_API WOLFSSL_METHOD * wolfTLSv1_3_method(
    void
)
```

This function returns a WOLFSSL_METHOD similar to wolfTLSv1_3_client_method except that it is not determined which side yet (server/client).

See:

- [wolfSSL_new](#)
- [wolfSSL_free](#)

Return:

- WOLFSSL_METHOD On successful creations returns a WOLFSSL_METHOD pointer
- NULL Null if memory allocation error or failure to create method

Example

```
WOLFSSL* ctx;
ctx = wolfSSL_CTX_new(wolfTLSv1_3_method());
// check ret value
```

17.6.2.96 function wolfSSL_GetCookieCtx

```
WOLFSSL_API void * wolfSSL_GetCookieCtx(
    WOLFSSL * ssl
)
```

This function returns the IOCB_CookieCtx member of the WOLFSSL structure.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using [wolfSSL_new\(\)](#).

See:

- [wolfSSL_SetCookieCtx](#)
- [wolfSSL_CTX_SetGenCookie](#)

Return:

- pointer The function returns a void pointer value stored in the IOCB_CookieCtx.
- NULL if the WOLFSSL struct is NULL

Example

```
WOLFSSL_CTX* ctx = wolfSSL_CTX_new( method );
WOLFSSL* ssl = wolfSSL_new(ctx);
void* cookie;
...
cookie = wolfSSL_GetCookieCtx(ssl);
if(cookie != NULL){
// You have the cookie
}
```

17.7.2 Functions Documentation

17.7.2.1 function wolfSSL_Debugging_ON

```
WOLFSSL_API int wolfSSL_Debugging_ON(
    void
)
```

If logging has been enabled at build time this function turns on logging at runtime. To enable logging at build time use `-enable-debug` or define `DEBUG_WOLFSSL`.

Parameters:

- **none** No parameters.

See:

- [wolfSSL_Debugging_OFF](#)
- [wolfSSL_SetLoggingCb](#)

Return:

- 0 upon success.
- `NOT_COMPILED_IN` is the error that will be returned if logging isn't enabled for this build.

Example

```
wolfSSL_Debugging_ON();
```

17.7.2.2 function wolfSSL_Debugging_OFF

```
WOLFSSL_API void wolfSSL_Debugging_OFF(
    void
)
```

This function turns off runtime logging messages. If they're already off, no action is taken.

Parameters:

- **none** No parameters.

See:

- [wolfSSL_Debugging_ON](#)
- [wolfSSL_SetLoggingCb](#)

Return: none No returns.

Example

```
wolfSSL_Debugging_OFF();
```

17.7.2.3 function wolfSSL_get_error

```
WOLFSSL_API int wolfSSL_get_error(  
    WOLFSSL * ,  
    int  
)
```

This function returns a unique error code describing why the previous API function call (wolfSSL_connect, wolfSSL_accept, wolfSSL_read, wolfSSL_write, etc.) resulted in an error return code (SSL_FAILURE). The return value of the previous function is passed to wolfSSL_get_error through ret. After wolfSSL_get_error is called and returns the unique error code, wolfSSL_ERR_error_string() may be called to get a human-readable error string. See wolfSSL_ERR_error_string() for more information.

Parameters:

- **ssl** pointer to the SSL object, created with [wolfSSL_new\(\)](#).
- **ret** return value of the previous function that resulted in an error return code.

See:

- [wolfSSL_ERR_error_string](#)
- [wolfSSL_ERR_error_string_n](#)
- [wolfSSL_ERR_print_errors_fp](#)
- [wolfSSL_load_error_strings](#)

Return:

- **code** On successful completion, this function will return the unique error code describing why the previous API function failed.
- SSL_ERROR_NONE will be returned if ret > 0.

Example

```
int err = 0;  
WOLFSSL* ssl;  
char buffer[80];  
...  
err = wolfSSL_get_error(ssl, 0);  
wolfSSL_ERR_error_string(err, buffer);  
printf("err = %d, %s\n", err, buffer);
```

17.7.2.4 function wolfSSL_load_error_strings

```
WOLFSSL_API void wolfSSL_load_error_strings(  
    void  
)
```

This function is for OpenSSL compatibility (SSL_load_error_string) only and takes no action.

Parameters:

- **none** No parameters.

See:

- [wolfSSL_get_error](#)

- [wolfSSL_ERR_error_string](#)
- [wolfSSL_ERR_error_string_n](#)
- [wolfSSL_ERR_print_errors_fp](#)
- [wolfSSL_load_error_strings](#)

Return: none No returns.

Example

```
wolfSSL_load_error_strings();
```

17.7.2.5 function [wolfSSL_ERR_error_string](#)

```
WOLFSSL_API char * wolfSSL_ERR_error_string(
    unsigned long ,
    char *
)
```

This function converts an error code returned by [wolfSSL_get_error\(\)](#) and data is the storage buffer which the error string will be placed in. The maximum length of data is 80 characters by default, as defined by MAX_ERROR_SZ is wolfssl/wolfcrypt/error.h.

Parameters:

- **errNumber** error code returned by [wolfSSL_get_error\(\)](#).
- **data** output buffer containing human-readable error string matching errNumber.

See:

- [wolfSSL_get_error](#)
- [wolfSSL_ERR_error_string_n](#)
- [wolfSSL_ERR_print_errors_fp](#)
- [wolfSSL_load_error_strings](#)

Return:

- success On successful completion, this function returns the same string as is returned in data.
- failure Upon failure, this function returns a string with the appropriate failure reason, msg.

Example

```
int err = 0;
WOLFSSL* ssl;
char buffer[80];
...
err = wolfSSL_get_error(ssl, 0);
wolfSSL_ERR_error_string(err, buffer);
printf("err = %d, %s\n", err, buffer);
```

17.7.2.6 function [wolfSSL_ERR_error_string_n](#)

```
WOLFSSL_API void wolfSSL_ERR_error_string_n(
    unsigned long e,
    char * buf,
    unsigned long sz
)
```

This function is a version of [wolfSSL_ERR_error_string\(\)](#) into a more human-readable error string. The human-readable string is placed in buf.

Parameters:

- **e** error code returned by `wolfSSL_get_error()`.
- **buff** output buffer containing human-readable error string matching e.
- **len** maximum length in characters which may be written to buf.

See:

- `wolfSSL_get_error`
- `wolfSSL_ERR_error_string`
- `wolfSSL_ERR_print_errors_fp`
- `wolfSSL_load_error_strings`

Return: none No returns.

Example

```
int err = 0;
WOLFSSL* ssl;
char buffer[80];
...
err = wolfSSL_get_error(ssl, 0);
wolfSSL_ERR_error_string_n(err, buffer, 80);
printf("err = %d, %s\n", err, buffer);
```

17.7.2.7 function `wolfSSL_ERR_print_errors_fp`

```
WOLFSSL_API void wolfSSL_ERR_print_errors_fp(
    FILE * ,
    int err
)
```

This function converts an error code returned by `wolfSSL_get_error()` and fp is the file which the error string will be placed in.

Parameters:

- **fp** output file for human-readable error string to be written to.
- **err** error code returned by `wolfSSL_get_error()`.

See:

- `wolfSSL_get_error`
- `wolfSSL_ERR_error_string`
- `wolfSSL_ERR_error_string_n`
- `wolfSSL_load_error_strings`

Return: none No returns.

Example

```
int err = 0;
WOLFSSL* ssl;
FILE* fp = ...
...
err = wolfSSL_get_error(ssl, 0);
wolfSSL_ERR_print_errors_fp(fp, err);
```

17.7.2.8 function `wolfSSL_ERR_print_errors_cb`

```
WOLFSSL_API void wolfSSL_ERR_print_errors_cb(
    int(*) (const char *str, size_t len, void *u) cb,
    void * u
```

)

This function uses the provided callback to handle error reporting. The callback function is executed for each error line. The string, length, and userdata are passed into the callback parameters.

Parameters:

- **cb** the callback function.
- **u** userdata to pass into the callback function.

See:

- [wolfSSL_get_error](#)
- [wolfSSL_ERR_error_string](#)
- [wolfSSL_ERR_error_string_n](#)
- [wolfSSL_load_error_strings](#)

Return: none No returns.

Example

```
int error_cb(const char *str, size_t len, void *u)
{ fprintf((FILE*)u, "%-*.*s\n", (int)len, (int)len, str); return 0; }
...
FILE* fp = ...
wolfSSL_ERR_print_errors_cb(error_cb, fp);
```

17.7.2.9 function wolfSSL_want_read

```
WOLFSSL_API int wolfSSL_want_read(
    WOLFSSL *
)
```

This function is similar to calling [wolfSSL_get_error\(\)](#) and getting `SSL_ERROR_WANT_READ` in return. If the underlying error state is `SSL_ERROR_WANT_READ`, this function will return 1, otherwise, 0.

Parameters:

- **ssl** pointer to the SSL session, created with [wolfSSL_new\(\)](#).

See:

- [wolfSSL_want_write](#)
- [wolfSSL_get_error](#)

Return:

- 1 [wolfSSL_get_error\(\)](#) would return `SSL_ERROR_WANT_READ`, the underlying I/O has data available for reading.
- 0 There is no `SSL_ERROR_WANT_READ` error state.

Example

```
int ret;
WOLFSSL* ssl = 0;
...

ret = wolfSSL_want_read(ssl);
if (ret == 1) {
    // underlying I/O has data available for reading (SSL_ERROR_WANT_READ)
}
```

17.7.2.10 function wolfSSL_want_write

```
WOLFSSL_API int wolfSSL_want_write(  
    WOLFSSL *  
)
```

This function is similar to calling `wolfSSL_get_error()` and getting `SSL_ERROR_WANT_WRITE` in return. If the underlying error state is `SSL_ERROR_WANT_WRITE`, this function will return 1, otherwise, 0.

Parameters:

- **ssl** pointer to the SSL session, created with `wolfSSL_new()`.

See:

- `wolfSSL_want_read`
- `wolfSSL_get_error`

Return:

- 1 `wolfSSL_get_error()` would return `SSL_ERROR_WANT_WRITE`, the underlying I/O needs data to be written in order for progress to be made in the underlying SSL connection.
- 0 There is no `SSL_ERROR_WANT_WRITE` error state.

Example

```
int ret;  
WOLFSSL* ssl = 0;  
...  
ret = wolfSSL_want_write(ssl);  
if (ret == 1) {  
    // underlying I/O needs data to be written (SSL_ERROR_WANT_WRITE)  
}
```

17.7.2.11 function wolfSSL_ERR_peek_last_error

```
WOLFSSL_API unsigned long wolfSSL_ERR_peek_last_error(  
    void  
)
```

This function returns the absolute value of the last error from `WOLFSSL_ERROR` encountered.

Parameters:

- **none** No parameters.

See: `wolfSSL_ERR_print_errors_fp`

Return: error Returns absolute value of last error.

Example

```
unsigned long err;  
...  
err = wolfSSL_ERR_peek_last_error();  
// inspect err value
```

17.8.2 Functions Documentation

17.8.2.1 function wolfSSL_shutdown

```
WOLFSSL_API int wolfSSL_shutdown(
    WOLFSSL *
)
```

This function shuts down an active SSL/TLS connection using the SSL session, ssl. This function will try to send a “close notify” alert to the peer. The calling application can choose to wait for the peer to send its “close notify” alert in response or just go ahead and shut down the underlying connection after directly calling wolfSSL_shutdown (to save resources). Either option is allowed by the TLS specification. If the underlying connection will be used again in the future, the complete two-directional shutdown procedure must be performed to keep synchronization intact between the peers. wolfSSL_shutdown() works with both blocking and non-blocking I/O. When the underlying I/O is non-blocking, wolfSSL_shutdown() will return an error if the underlying I/O could not satisfy the needs of wolfSSL_shutdown() to continue. In this case, a call to **wolfSSL_get_error()** will yield either SSL_ERROR_WANT_READ or SSL_ERROR_WANT_WRITE. The calling process must then repeat the call to wolfSSL_shutdown() when the underlying I/O is ready.

Parameters:

- **ssl** pointer to the SSL session created with **wolfSSL_new()**.

See:

- **wolfSSL_free**
- **wolfSSL_CTX_free**

Return:

- SSL_SUCCESS will be returned upon success.
- SSL_SHUTDOWN_NOT_DONE will be returned when shutdown has not finished, and the function should be called again.
- SSL_FATAL_ERROR will be returned upon failure. Call **wolfSSL_get_error()** for a more specific error code.

Example

```
#include <wolfssl/ssl.h>
```

```
int ret = 0;
WOLFSSL* ssl = 0;
...
```

```
ret = wolfSSL_shutdown(ssl);
if (ret != 0) {
    // failed to shut down SSL connection
}
```

17.8.2.2 function wolfSSL_SetServerID

```
WOLFSSL_API int wolfSSL_SetServerID(
    WOLFSSL *,
    const unsigned char *,
    int,
    int
)
```

This function associates the client session with the server id. If the newSession flag is on, an existing session won't be reused.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using `wolfSSL_new()`.
- **id** a constant byte pointer that will be copied to the serverID member of the WOLFSSL_SESSION structure.
- **len** an int type representing the length of the session id parameter.
- **newSession** an int type representing the flag to denote whether to reuse a session or not.

See: GetSessionClient

Return:

- SSL_SUCCESS returned if the function executed without error.
- BAD_FUNC_ARG returned if the WOLFSSL struct or id parameter is NULL or if len is not greater than zero.

Example

```
WOLFSSL_CTX* ctx = wolfSSL_CTX_new( protocol );
WOLFSSL* ssl = WOLFSSL_new(ctx);
const byte id[MAX_SIZE]; // or dynamically create space
int len = 0; // initialize length
int newSession = 0; // flag to allow
...
int ret = wolfSSL_SetServerID(ssl, id, len, newSession);

if (ret == WOLFSSL_SUCCESS) {
    // The Id was successfully set
}
```

17.8.2.3 function wolfSSL_library_init

```
WOLFSSL_API int wolfSSL_library_init(
    void
)
```

This function is called internally in `wolfSSL_CTX_new()`. This function is a wrapper around `wolfSSL_Init()` and exists for OpenSSL compatibility (`SSL_library_init`) when wolfSSL has been compiled with OpenSSL compatibility layer. `wolfSSL_Init()` is the more typically-used wolfSSL initialization function.

Parameters:

- **none** No parameters.

See:

- [wolfSSL_Init](#)
- [wolfSSL_Cleanup](#)

Return:

- SSL_SUCCESS If successful the call will return.
- SSL_FATAL_ERROR is returned upon failure.

Example

```
int ret = 0;
ret = wolfSSL_library_init();
if (ret != SSL_SUCCESS) {
    failed to initialize wolfSSL
}
...
```

17.8.2.4 function `wolfSSL_get_shutdown`

```
WOLFSSL_API int wolfSSL_get_shutdown(
    const WOLFSSL *
```

)

This function checks the shutdown conditions in `closeNotify` or `connReset` or `sentNotify` members of the Options structure. The Options structure is within the WOLFSSL structure.

Parameters:

- **ssl** a constant pointer to a WOLFSSL structure, created using [wolfSSL_new\(\)](#).

See: `wolfSSL_SESSION_free`

Return:

- 1 SSL_SENT_SHUTDOWN is returned.
- 2 SSL_RECEIVED_SHUTDOWN is returned.

Example

```
#include <wolfssl/ssl.h>

WOLFSSL_CTX* ctx = WOLFSSL_CTX_new( protocol method );
WOLFSSL* ssl = WOLFSSL_new(ctx);
...
int ret;
ret = wolfSSL_get_shutdown(ssl);

if(ret == 1){
    SSL_SENT_SHUTDOWN
} else if(ret == 2){
    SSL_RECEIVED_SHUTDOWN
} else {
    Fatal error.
}
```

17.8.2.5 function `wolfSSL_is_init_finished`

```
WOLFSSL_API int wolfSSL_is_init_finished(
    WOLFSSL *
```

)

This function checks to see if the connection is established.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using `wolfSSL_new()`.

See:

- `wolfSSL_set_accept_state`
- `wolfSSL_get_keys`
- `wolfSSL_set_shutdown`

Return:

- 0 returned if the connection is not established, i.e. the WOLFSSL struct is NULL or the handshake is not done.
- 1 returned if the connection is not established i.e. the WOLFSSL struct is null or the handshake is not done.

EXAMPLE

```
#include <wolfssl/ssl.h>
```

```
WOLFSSL_CTX* ctx = wolfSSL_CTX_new( protocol method );
```

```
WOLFSSL* ssl = wolfSSL_new(ctx);
```

```
...
```

```
if(wolfSSL_is_init_finished(ssl)){  
    Handshake is done and connection is established  
}
```

17.8.2.6 function `wolfSSL_Init`

```
WOLFSSL_API int wolfSSL_Init(  
    void  
)
```

Initializes the wolfSSL library for use. Must be called once per application and before any other call to the library.

See: `wolfSSL_Cleanup`

Return:

- `SSL_SUCCESS` If successful the call will return.
- `BAD_MUTEX_E` is an error that may be returned.
- `WC_INIT_E` wolfCrypt initialization error returned.

Example

```
int ret = 0;  
ret = wolfSSL_Init();  
if (ret != SSL_SUCCESS) {  
    failed to initialize wolfSSL library  
}
```

17.8.2.7 function `wolfSSL_Cleanup`

```
WOLFSSL_API int wolfSSL_Cleanup(  
    void  
)
```

Un-initializes the wolfSSL library from further use. Doesn't have to be called, though it will free any resources used by the library.

See: [wolfSSL_Init](#)

Return:

- SSL_SUCCESS return no errors.
- BAD_MUTEX_E a mutex error return.]

Example

```
wolfSSL_Cleanup();
```

17.8.2.8 function `wolfSSL_SetMinVersion`

```
WOLFSSL_API int wolfSSL_SetMinVersion(  
    WOLFSSL * ssl,  
    int version  
)
```

This function sets the minimum downgrade version allowed. Applicable only when the connection allows downgrade using (`wolfSSLv23_client_method` or `wolfSSLv23_server_method`).

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using [wolfSSL_new\(\)](#).
- **version** an integer representation of the version to be set as the minimum: WOLFSSL_SSLV3 = 0, WOLFSSL_TLSV1 = 1, WOLFSSL_TLSV1_1 = 2 or WOLFSSL_TLSV1_2 = 3.

See: `SetMinVersionHelper`

Return:

- SSL_SUCCESS returned if this function and its subroutine executes without error.
- BAD_FUNC_ARG returned if the SSL object is NULL. In the subroutine this error is thrown if there is not a good version match.

Example

```
WOLFSSL_CTX* ctx = WOLFSSL_CTX_new(protocol method);  
WOLFSSL* ssl = WOLFSSL_new(ctx);  
int version; macro representation  
...  
if(wolfSSL_CTX_SetMinVersion(ssl->ctx, version) != SSL_SUCCESS){  
    Failed to set min version  
}
```

17.8.2.9 function `wolfSSL_ALPN_GetProtocol`

```
WOLFSSL_API int wolfSSL_ALPN_GetProtocol(  
    WOLFSSL * ssl,  
    char ** protocol_name,  
    unsigned short * size  
)
```

This function gets the protocol name set by the server.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using [wolfSSL_new\(\)](#).

- **protocol_name** a pointer to a char that represents the protocol name and will be held in the ALPN structure.
- **size** a word16 type that represents the size of the protocol_name.

See:

- TLSX_ALPN_GetRequest
- TLSX_Find

Return:

- SSL_SUCCESS returned on successful execution where no errors were thrown.
- SSL_FATAL_ERROR returned if the extension was not found or if there was no protocol match with peer. There will also be an error thrown if there is more than one protocol name accepted.
- SSL_ALPN_NOT_FOUND returned signifying that no protocol match with peer was found.
- BAD_FUNC_ARG returned if there was a NULL argument passed into the function.

Example

```
WOLFSSL_CTX* ctx = WOLFSSL_CTX_new( protocol method );
WOLFSSL* ssl = WOLFSSL_new(ctx);
...
int err;
char* protocol_name = NULL;
Word16 protocol_nameSz = 0;
err = wolfSSL_ALPN_GetProtocol(ssl, &protocol_name, &protocol_nameSz);

if(err == SSL_SUCCESS){
    // Sent ALPN protocol
}
```

17.8.2.10 function wolfSSL_ALPN_GetPeerProtocol

```
WOLFSSL_API int wolfSSL_ALPN_GetPeerProtocol(
    WOLFSSL * ssl,
    char ** list,
    unsigned short * listSz
)
```

This function copies the alpn_client_list data from the SSL object to the buffer.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using [wolfSSL_new\(\)](#).
- **list** a pointer to the buffer. The data from the SSL object will be copied into it.
- **listSz** the buffer size.

See: [wolfSSL_UseALPN](#)

Return:

- SSL_SUCCESS returned if the function executed without error. The alpn_client_list member of the SSL object has been copied to the list parameter.
- BAD_FUNC_ARG returned if the list or listSz parameter is NULL.
- BUFFER_ERROR returned if there will be a problem with the list buffer (either it's NULL or the size is 0).
- MEMORY_ERROR returned if there was a problem dynamically allocating memory.

Example

```

#import <wolfssl/ssl.h>

WOLFSSL_CTX* ctx = wolfSSL_CTX_new( protocol method);
WOLFSSL* ssl = wolfSSL_new(ctx);
...
#ifdef HAVE_ALPN
char* list = NULL;
word16 listSz = 0;
...
err = wolfSSL_ALPN_GetPeerProtocol(ssl, &list, &listSz);

if(err == SSL_SUCCESS){
    List of protocols names sent by client
}

```

17.8.2.11 function wolfSSL_MakeTlsMasterSecret

```

WOLFSSL_API int wolfSSL_MakeTlsMasterSecret(
    unsigned char * ms,
    word32 msLen,
    const unsigned char * pms,
    word32 pmsLen,
    const unsigned char * cr,
    const unsigned char * sr,
    int tls1_2,
    int hash_type
)

```

This function copies the values of cr and sr then passes through to wc_PRF (pseudo random function) and returns that value.

Parameters:

- **ms** the master secret held in the Arrays structure.
- **msLen** the length of the master secret.
- **pms** the pre-master secret held in the Arrays structure.
- **pmsLen** the length of the pre-master secret.
- **cr** the client random.
- **sr** the server random.
- **tls1_2** signifies that the version is at least tls version 1.2.
- **hash_type** signifies the hash type.

See:

- wc_PRF
- MakeTlsMasterSecret

Return:

- 0 on success
- BUFFER_E returned if there will be an error with the size of the buffer.
- MEMORY_E returned if a subroutine failed to allocate dynamic memory.

Example

```
WOLFSSL* ssl;
```

called in MakeTlsMasterSecret **and** retrieves the necessary information as follows:

```

int MakeTlsMasterSecret(WOLFSSL* ssl){
int ret;
ret = wolfSSL_makeTlsMasterSecret(ssl->arrays->masterSecret, SECRET_LEN,
ssl->arrays->preMasterSecret, ssl->arrays->preMasterSz,
ssl->arrays->clientRandom, ssl->arrays->serverRandom,
IsAtLeastTlsV1_2(ssl), ssl->specs.mac_algorithm);
...
return ret;
}

```

17.8.2.12 function wolfSSL_preferred_group

```

WOLFSSL_API int wolfSSL_preferred_group(
    WOLFSSL * ssl
)

```

This function returns the key exchange group the client prefers to use in the TLS v1.3 handshake. Call this function to after a handshake is complete to determine which group the server prefers so that this information can be used in future connections to pre-generate a key pair for key exchange.

Parameters:

- **ssl** a pointer to a WOLFSSL structure, created using [wolfSSL_new\(\)](#).

See:

- [wolfSSL_UseKeyShare](#)
- [wolfSSL_CTX_set_groups](#)
- [wolfSSL_set_groups](#)
- [wolfSSL_CTX_set1_groups_list](#)
- [wolfSSL_set1_groups_list](#)

Return:

- BAD_FUNC_ARG if ssl is NULL or not using TLS v1.3.
- SIDE_ERROR if called with a server.
- NOT_READY_ERROR if called before handshake is complete.
- Group identifier if successful.

Example

```

int ret;
int group;
WOLFSSL* ssl;
...
ret = wolfSSL_CTX_set1_groups_list(ssl)
if (ret < 0) {
    // failed to get group
}
group = ret;

```

18.1.2 Functions Documentation

18.1.2.1 function wc_InitCert

```
WOLFSSL_API int wc_InitCert(
    Cert *
)
```

This function initializes a default cert, with the default options: version = 3 (0x2), serial = 0, sigType = SHA_WITH_RSA, issuer = blank, daysValid = 500, selfSigned = 1 (true) use subject as issuer, subject = blank.

Parameters:

- **cert** pointer to an uninitialized cert structure to initialize

See:

- [wc_MakeCert](#)
- [wc_MakeCertReq](#)

Return: none No returns.

Example

```
Cert myCert;
wc_InitCert(&myCert);
```

18.1.2.2 function wc_MakeCert

```
WOLFSSL_API int wc_MakeCert(
    Cert * ,
    byte * derBuffer,
    word32 derSz,
    RsaKey * ,
    ecc_key * ,
    WC_RNG *
)
```

Used to make CA signed certs. Called after the subject information has been entered. This function makes an x509 Certificate v3 RSA or ECC from a cert input. It then writes this cert to derBuffer. It takes in either an rsaKey or an eccKey to generate the certificate. The certificate must be initialized with wc_InitCert before this method is called.

Parameters:

- **cert** pointer to an initialized cert structure
- **derBuffer** pointer to the buffer in which to hold the generated cert
- **derSz** size of the buffer in which to store the cert
- **rsaKey** pointer to an RsaKey structure containing the rsa key used to generate the certificate
- **eccKey** pointer to an EccKey structure containing the ecc key used to generate the certificate
- **rng** pointer to the random number generator used to make the cert

See:

- [wc_InitCert](#)
- [wc_MakeCertReq](#)

Return:

- Success On successfully making an x509 certificate from the specified input cert, returns the size of the cert generated.
- MEMORY_E Returned if there is an error allocating memory with XMALLOC
- BUFFER_E Returned if the provided derBuffer is too small to store the generated certificate
- Others Additional error messages may be returned if the cert generation is not successful.

Example

```
Cert myCert;
wc_InitCert(&myCert);
WC_RNG rng;
//initialize rng;
RsaKey key;
//initialize key;
byte * derCert = malloc(FOURK_BUF);
word32 certSz;
certSz = wc_MakeCert(&myCert, derCert, FOURK_BUF, &key, NULL, &rng);
```

18.1.2.3 function wc_MakeCertReq

```
WOLFSSL_API int wc_MakeCertReq(  
    Cert * ,  
    byte * derBuffer,  
    word32 derSz,  
    RsaKey * ,  
    ecc_key *  
)
```

This function makes a certificate signing request using the input certificate and writes the output to derBuffer. It takes in either an rsaKey or an eccKey to generate the certificate request. wc_SignCert() will need to be called after this function to sign the certificate request. Please see the wolfCrypt test application (./wolfcrypt/test/test.c) for an example usage of this function.

Parameters:

- **cert** pointer to an initialized cert structure
- **derBuffer** pointer to the buffer in which to hold the generated certificate request
- **derSz** size of the buffer in which to store the certificate request
- **rsaKey** pointer to an RsaKey structure containing the rsa key used to generate the certificate request
- **eccKey** pointer to an EccKey structure containing the ecc key used to generate the certificate request

See:

- [wc_InitCert](#)
- [wc_MakeCert](#)

Return:

- Success On successfully making an X.509 certificate request from the specified input cert, returns the size of the certificate request generated.
- MEMORY_E Returned if there is an error allocating memory with XMALLOC
- BUFFER_E Returned if the provided derBuffer is too small to store the generated certificate
- Other Additional error messages may be returned if the certificate request generation is not successful.

Example

```
Cert myCert;  
// initialize myCert  
EccKey key;  
//initialize key;  
byte* derCert = (byte*)malloc(FOURK_BUF);  
  
word32 certSz;  
certSz = wc_MakeCertReq(&myCert, derCert, FOURK_BUF, NULL, &key);
```

18.1.2.4 function wc_MakeSelfCert

```
WOLFSSL_API int wc_MakeSelfCert(  
    Cert * ,  
    byte * derBuffer,  
    word32 derSz,  
    RsaKey * ,  
    WC_RNG *  
)
```

This function is a combination of the previous two functions, `wc_MakeCert` and `wc_SignCert` for self signing (the previous functions may be used for CA requests). It makes a certificate, and then signs it, generating a self-signed certificate.

Parameters:

- **cert** pointer to the cert to make and sign
- **buffer** pointer to the buffer in which to hold the signed certificate
- **buffSz** size of the buffer in which to store the signed certificate
- **key** pointer to an `RsaKey` structure containing the rsa key to used to sign the certificate
- **rng** pointer to the random number generator used to generate and sign the certificate

See:

- [wc_InitCert](#)
- [wc_MakeCert](#)
- [wc_SignCert](#)

Return:

- Success On successfully signing the certificate, returns the new size of the cert.
- `MEMORY_E` Returned if there is an error allocating memory with `XMALLOC`
- `BUFFER_E` Returned if the provided buffer is too small to store the generated certificate
- Other Additional error messages may be returned if the cert generation is not successful.

Example

```
Cert myCert;
byte* derCert = (byte*)malloc(FOURK_BUF);
// initialize myCert, derCert
RsaKey key;
// initialize key;
WC_RNG rng;
// initialize rng

word32 certSz;
certSz = wc_MakeSelfCert(&myCert, derCert, FOURK_BUF, &key, NULL, &rng);
```

18.1.2.5 function `wc_SetIssuer`

```
WOLFSSL_API int wc_SetIssuer(
    Cert *,
    const char *
)
```

This function sets the issuer for a certificate to the issuer in the provided pem issuerFile. It also changes the certificate's self-signed attribute to false. The issuer specified in issuerFile is verified prior to setting the cert issuer. This method is used to set fields prior to signing.

Parameters:

- **cert** pointer to the cert for which to set the issuer
- **issuerFile** path of the file containing the pem formatted certificate

See:

- [wc_InitCert](#)
- [wc_SetSubject](#)
- [wc_SetIssuerBuffer](#)

Return:

- 0 Returned on successfully setting the issuer for the certificate
- MEMORY_E Returned if there is an error allocating memory with XMALLOC
- ASN_PARSE_E Returned if there is an error parsing the cert header file
- ASN_OBJECT_ID_E Returned if there is an error parsing the encryption type from the cert
- ASN_EXPECT_0_E Returned if there is a formatting error in the encryption specification of the cert file
- ASN_BEFORE_DATE_E Returned if the date is before the certificate start date
- ASN_AFTER_DATE_E Returned if the date is after the certificate expiration date
- ASN_BITSTR_E Returned if there is an error parsing a bit string from the certificate
- ECC_CURVE_OID_E Returned if there is an error parsing the ECC key from the certificate
- ASN_UNKNOWN_OID_E Returned if the certificate is using an unknown key object id
- ASN_VERSION_E Returned if the ALLOW_V1_EXTENSIONS option is not defined and the certificate is a V1 or V2 certificate
- BAD_FUNC_ARG Returned if there is an error processing the certificate extension
- ASN_CRIT_EXT_E Returned if an unfamiliar critical extension is encountered in processing the certificate
- ASN_SIG_OID_E Returned if the signature encryption type is not the same as the encryption type of the certificate in the provided file
- ASN_SIG_CONFIRM_E Returned if confirming the certification signature fails
- ASN_NAME_INVALID_E Returned if the certificate's name is not permitted by the CA name constraints
- ASN_NO_SIGNER_E Returned if there is no CA signer to verify the certificate's authenticity

Example

```
Cert myCert;
// initialize myCert
if(wc_SetIssuer(&myCert, "../path/to/ca-cert.pem") != 0) {
    // error setting issuer
}
```

18.1.2.6 function wc_SetSubject

```
WOLFSSL_API int wc_SetSubject(
    Cert *,
    const char *
)
```

This function sets the subject for a certificate to the subject in the provided pem subjectFile. This method is used to set fields prior to signing.

Parameters:

- **cert** pointer to the cert for which to set the issuer
- **subjectFile** path of the file containing the pem formatted certificate

See:

- [wc_InitCert](#)
- [wc_SetIssuer](#)

Return:

- 0 Returned on successfully setting the issuer for the certificate
- MEMORY_E Returned if there is an error allocating memory with XMALLOC
- ASN_PARSE_E Returned if there is an error parsing the cert header file
- ASN_OBJECT_ID_E Returned if there is an error parsing the encryption type from the cert
- ASN_EXPECT_0_E Returned if there is a formatting error in the encryption specification of the cert file

- ASN_BEFORE_DATE_E Returned if the date is before the certificate start date
- ASN_AFTER_DATE_E Returned if the date is after the certificate expiration date
- ASN_BITSTR_E Returned if there is an error parsing a bit string from the certificate
- ECC_CURVE_OID_E Returned if there is an error parsing the ECC key from the certificate
- ASN_UNKNOWN_OID_E Returned if the certificate is using an unknown key object id
- ASN_VERSION_E Returned if the ALLOW_V1_EXTENSIONS option is not defined and the certificate is a V1 or V2 certificate
- BAD_FUNC_ARG Returned if there is an error processing the certificate extension
- ASN_CRIT_EXT_E Returned if an unfamiliar critical extension is encountered in processing the certificate
- ASN_SIG_OID_E Returned if the signature encryption type is not the same as the encryption type of the certificate in the provided file
- ASN_SIG_CONFIRM_E Returned if confirming the certification signature fails
- ASN_NAME_INVALID_E Returned if the certificate's name is not permitted by the CA name constraints
- ASN_NO_SIGNER_E Returned if there is no CA signer to verify the certificate's authenticity

Example

```
Cert myCert;
// initialize myCert
if(wc_SetSubject(&myCert, "../path/to/ca-cert.pem") != 0) {
    // error setting subject
}
```

18.1.2.7 function wc_SetSubjectRaw

```
WOLFSSL_API int wc_SetSubjectRaw(
    Cert * cert,
    const byte * der,
    int derSz
)
```

This function sets the raw subject for a certificate from the subject in the provided der buffer. This method is used to set the raw subject field prior to signing.

Parameters:

- **cert** pointer to the cert for which to set the raw subject
- **der** pointer to the buffer containing the der formatted certificate from which to grab the subject
- **derSz** size of the buffer containing the der formatted certificate from which to grab the subject

See:

- [wc_InitCert](#)
- [wc_SetSubject](#)

Return:

- 0 Returned on successfully setting the subject for the certificate
- MEMORY_E Returned if there is an error allocating memory with XMALLOC
- ASN_PARSE_E Returned if there is an error parsing the cert header file
- ASN_OBJECT_ID_E Returned if there is an error parsing the encryption type from the cert
- ASN_EXPECT_0_E Returned if there is a formatting error in the encryption specification of the cert file
- ASN_BEFORE_DATE_E Returned if the date is before the certificate start date
- ASN_AFTER_DATE_E Returned if the date is after the certificate expiration date
- ASN_BITSTR_E Returned if there is an error parsing a bit string from the certificate
- ECC_CURVE_OID_E Returned if there is an error parsing the ECC key from the certificate

- ASN_UNKNOWN_OID_E Returned if the certificate is using an unknown key object id
- ASN_VERSION_E Returned if the ALLOW_V1_EXTENSIONS option is not defined and the certificate is a V1 or V2 certificate
- BAD_FUNC_ARG Returned if there is an error processing the certificate extension
- ASN_CRIT_EXT_E Returned if an unfamiliar critical extension is encountered in processing the certificate
- ASN_SIG_OID_E Returned if the signature encryption type is not the same as the encryption type of the certificate in the provided file
- ASN_SIG_CONFIRM_E Returned if confirming the certification signature fails
- ASN_NAME_INVALID_E Returned if the certificate's name is not permitted by the CA name constraints
- ASN_NO_SIGNER_E Returned if there is no CA signer to verify the certificate's authenticity

Example

```
Cert myCert;
// initialize myCert
byte* der;
der = (byte*)malloc(FOURK_BUF);
// initialize der
if(wc_SetSubjectRaw(&myCert, der, FOURK_BUF) != 0) {
    // error setting subject
}
```

18.1.2.8 function wc_GetSubjectRaw

```
WOLFSSL_API int wc_GetSubjectRaw(
    byte ** subjectRaw,
    Cert * cert
)
```

This function gets the raw subject from the certificate structure.

Parameters:

- **subjectRaw** pointer-pointer to the raw subject upon successful return
- **cert** pointer to the cert from which to get the raw subject

See:

- [wc_InitCert](#)
- [wc_SetSubjectRaw](#)

Return:

- 0 Returned on successfully getting the subject from the certificate
- BAD_FUNC_ARG Returned if there is an error processing the certificate extension

Example

```
Cert myCert;
byte *subjRaw;
// initialize myCert
if(wc_GetSubjectRaw(&subjRaw, &myCert) != 0) {
    // error setting subject
}
```

18.1.2.9 function `wc_SetAltNames`

```
WOLFSSL_API int wc_SetAltNames(  
    Cert * ,  
    const char *  
)
```

This function sets the alternate names for a certificate to the alternate names in the provided pem file. This is useful in the case that one wishes to secure multiple domains with the same certificate. This method is used to set fields prior to signing.

Parameters:

- **cert** pointer to the cert for which to set the alt names
- **file** path of the file containing the pem formatted certificate

See:

- [wc_InitCert](#)
- [wc_SetIssuer](#)

Return:

- 0 Returned on successfully setting the alt names for the certificate
- MEMORY_E Returned if there is an error allocating memory with XMALLOC
- ASN_PARSE_E Returned if there is an error parsing the cert header file
- ASN_OBJECT_ID_E Returned if there is an error parsing the encryption type from the cert
- ASN_EXPECT_0_E Returned if there is a formatting error in the encryption specification of the cert file
- ASN_BEFORE_DATE_E Returned if the date is before the certificate start date
- ASN_AFTER_DATE_E Returned if the date is after the certificate expiration date
- ASN_BITSTR_E Returned if there is an error parsing a bit string from the certificate
- ECC_CURVE_OID_E Returned if there is an error parsing the ECC key from the certificate
- ASN_UNKNOWN_OID_E Returned if the certificate is using an unknown key object id
- ASN_VERSION_E Returned if the ALLOW_V1_EXTENSIONS option is not defined and the certificate is a V1 or V2 certificate
- BAD_FUNC_ARG Returned if there is an error processing the certificate extension
- ASN_CRIT_EXT_E Returned if an unfamiliar critical extension is encountered in processing the certificate
- ASN_SIG_OID_E Returned if the signature encryption type is not the same as the encryption type of the certificate in the provided file
- ASN_SIG_CONFIRM_E Returned if confirming the certification signature fails
- ASN_NAME_INVALID_E Returned if the certificate's name is not permitted by the CA name constraints
- ASN_NO_SIGNER_E Returned if there is no CA signer to verify the certificate's authenticity

Example

```
Cert myCert;  
// initialize myCert  
if(wc_SetSubject(&myCert, "../path/to/ca-cert.pem") != 0) {  
    // error setting alt names  
}
```

18.1.2.10 function `wc_SetIssuerBuffer`

```
WOLFSSL_API int wc_SetIssuerBuffer(  
    Cert * ,  
    const byte * ,
```

```
    int
)
```

This function sets the issuer for a certificate from the issuer in the provided der buffer. It also changes the certificate's self-signed attribute to false. This method is used to set fields prior to signing.

Parameters:

- **cert** pointer to the cert for which to set the issuer
- **der** pointer to the buffer containing the der formatted certificate from which to grab the issuer
- **derSz** size of the buffer containing the der formatted certificate from which to grab the issuer

See:

- [wc_InitCert](#)
- [wc_SetIssuer](#)

Return:

- 0 Returned on successfully setting the issuer for the certificate
- MEMORY_E Returned if there is an error allocating memory with XMALLOC
- ASN_PARSE_E Returned if there is an error parsing the cert header file
- ASN_OBJECT_ID_E Returned if there is an error parsing the encryption type from the cert
- ASN_EXPECT_0_E Returned if there is a formatting error in the encryption specification of the cert file
- ASN_BEFORE_DATE_E Returned if the date is before the certificate start date
- ASN_AFTER_DATE_E Returned if the date is after the certificate expiration date
- ASN_BITSTR_E Returned if there is an error parsing a bit string from the certificate
- ECC_CURVE_OID_E Returned if there is an error parsing the ECC key from the certificate
- ASN_UNKNOWN_OID_E Returned if the certificate is using an unknown key object id
- ASN_VERSION_E Returned if the ALLOW_V1_EXTENSIONS option is not defined and the certificate is a V1 or V2 certificate
- BAD_FUNC_ARG Returned if there is an error processing the certificate extension
- ASN_CRIT_EXT_E Returned if an unfamiliar critical extension is encountered in processing the certificate
- ASN_SIG_OID_E Returned if the signature encryption type is not the same as the encryption type of the certificate in the provided file
- ASN_SIG_CONFIRM_E Returned if confirming the certification signature fails
- ASN_NAME_INVALID_E Returned if the certificate's name is not permitted by the CA name constraints
- ASN_NO_SIGNER_E Returned if there is no CA signer to verify the certificate's authenticity

Example

```
Cert myCert;
// initialize myCert
byte* der;
der = (byte*)malloc(FOURK_BUF);
// initialize der
if(wc_SetIssuerBuffer(&myCert, der, FOURK_BUF) != 0) {
    // error setting issuer
}
```

18.1.2.11 function wc_SetIssuerRaw

```
WOLFSSL_API int wc_SetIssuerRaw(
    Cert * cert,
    const byte * der,
    int derSz
```

)

This function sets the raw issuer for a certificate from the issuer in the provided der buffer. This method is used to set the raw issuer field prior to signing.

Parameters:

- **cert** pointer to the cert for which to set the raw issuer
- **der** pointer to the buffer containing the der formatted certificate from which to grab the subject
- **derSz** size of the buffer containing the der formatted certificate from which to grab the subject

See:

- [wc_InitCert](#)
- [wc_SetIssuer](#)

Return:

- 0 Returned on successfully setting the issuer for the certificate
- MEMORY_E Returned if there is an error allocating memory with XMALLOC
- ASN_PARSE_E Returned if there is an error parsing the cert header file
- ASN_OBJECT_ID_E Returned if there is an error parsing the encryption type from the cert
- ASN_EXPECT_0_E Returned if there is a formatting error in the encryption specification of the cert file
- ASN_BEFORE_DATE_E Returned if the date is before the certificate start date
- ASN_AFTER_DATE_E Returned if the date is after the certificate expiration date
- ASN_BITSTR_E Returned if there is an error parsing a bit string from the certificate
- ECC_CURVE_OID_E Returned if there is an error parsing the ECC key from the certificate
- ASN_UNKNOWN_OID_E Returned if the certificate is using an unknown key object id
- ASN_VERSION_E Returned if the ALLOW_V1_EXTENSIONS option is not defined and the certificate is a V1 or V2 certificate
- BAD_FUNC_ARG Returned if there is an error processing the certificate extension
- ASN_CRIT_EXT_E Returned if an unfamiliar critical extension is encountered in processing the certificate
- ASN_SIG_OID_E Returned if the signature encryption type is not the same as the encryption type of the certificate in the provided file
- ASN_SIG_CONFIRM_E Returned if confirming the certification signature fails
- ASN_NAME_INVALID_E Returned if the certificate's name is not permitted by the CA name constraints
- ASN_NO_SIGNER_E Returned if there is no CA signer to verify the certificate's authenticity

Example

```
Cert myCert;
// initialize myCert
byte* der;
der = (byte*)malloc(FOURK_BUF);
// initialize der
if(wc_SetIssuerRaw(&myCert, der, FOURK_BUF) != 0) {
    // error setting subject
}
```

18.1.2.12 function wc_SetSubjectBuffer

```
WOLFSSL_API int wc_SetSubjectBuffer(
    Cert *,
    const byte *,
    int
)
```

This function sets the subject for a certificate from the subject in the provided der buffer. This method is used to set fields prior to signing.

Parameters:

- **cert** pointer to the cert for which to set the subject
- **der** pointer to the buffer containing the der formatted certificate from which to grab the subject
- **derSz** size of the buffer containing the der formatted certificate from which to grab the subject

See:

- [wc_InitCert](#)
- [wc_SetSubject](#)

Return:

- 0 Returned on successfully setting the subject for the certificate
- MEMORY_E Returned if there is an error allocating memory with XMALLOC
- ASN_PARSE_E Returned if there is an error parsing the cert header file
- ASN_OBJECT_ID_E Returned if there is an error parsing the encryption type from the cert
- ASN_EXPECT_0_E Returned if there is a formatting error in the encryption specification of the cert file
- ASN_BEFORE_DATE_E Returned if the date is before the certificate start date
- ASN_AFTER_DATE_E Returned if the date is after the certificate expiration date
- ASN_BITSTR_E Returned if there is an error parsing a bit string from the certificate
- ECC_CURVE_OID_E Returned if there is an error parsing the ECC key from the certificate
- ASN_UNKNOWN_OID_E Returned if the certificate is using an unknown key object id
- ASN_VERSION_E Returned if the ALLOW_V1_EXTENSIONS option is not defined and the certificate is a V1 or V2 certificate
- BAD_FUNC_ARG Returned if there is an error processing the certificate extension
- ASN_CRIT_EXT_E Returned if an unfamiliar critical extension is encountered in processing the certificate
- ASN_SIG_OID_E Returned if the signature encryption type is not the same as the encryption type of the certificate in the provided file
- ASN_SIG_CONFIRM_E Returned if confirming the certification signature fails
- ASN_NAME_INVALID_E Returned if the certificate's name is not permitted by the CA name constraints
- ASN_NO_SIGNER_E Returned if there is no CA signer to verify the certificate's authenticity

Example

```
Cert myCert;
// initialize myCert
byte* der;
der = (byte*)malloc(FOURK_BUF);
// initialize der
if(wc_SetSubjectBuffer(&myCert, der, FOURK_BUF) != 0) {
    // error setting subject
}
```

18.1.2.13 function wc_SetAltNamesBuffer

```
WOLFSSL_API int wc_SetAltNamesBuffer(
    Cert *,
    const byte *,
    int
)
```

This function sets the alternate names for a certificate from the alternate names in the provided der buffer. This is useful in the case that one wishes to secure multiple domains with the same certificate. This method is used to set fields prior to signing.

Parameters:

- **cert** pointer to the cert for which to set the alternate names
- **der** pointer to the buffer containing the der formatted certificate from which to grab the alternate names
- **derSz** size of the buffer containing the der formatted certificate from which to grab the alternate names

See:

- [wc_InitCert](#)
- [wc_SetAltNames](#)

Return:

- 0 Returned on successfully setting the alternate names for the certificate
- MEMORY_E Returned if there is an error allocating memory with XMALLOC
- ASN_PARSE_E Returned if there is an error parsing the cert header file
- ASN_OBJECT_ID_E Returned if there is an error parsing the encryption type from the cert
- ASN_EXPECT_0_E Returned if there is a formatting error in the encryption specification of the cert file
- ASN_BEFORE_DATE_E Returned if the date is before the certificate start date
- ASN_AFTER_DATE_E Returned if the date is after the certificate expiration date
- ASN_BITSTR_E Returned if there is an error parsing a bit string from the certificate
- ECC_CURVE_OID_E Returned if there is an error parsing the ECC key from the certificate
- ASN_UNKNOWN_OID_E Returned if the certificate is using an unknown key object id
- ASN_VERSION_E Returned if the ALLOW_V1_EXTENSIONS option is not defined and the certificate is a V1 or V2 certificate
- BAD_FUNC_ARG Returned if there is an error processing the certificate extension
- ASN_CRIT_EXT_E Returned if an unfamiliar critical extension is encountered in processing the certificate
- ASN_SIG_OID_E Returned if the signature encryption type is not the same as the encryption type of the certificate in the provided file
- ASN_SIG_CONFIRM_E Returned if confirming the certification signature fails
- ASN_NAME_INVALID_E Returned if the certificate's name is not permitted by the CA name constraints
- ASN_NO_SIGNER_E Returned if there is no CA signer to verify the certificate's authenticity

Example

```
Cert myCert;
// initialize myCert
byte* der;
der = (byte*)malloc(FOURK_BUF);
// initialize der
if(wc_SetAltNamesBuffer(&myCert, der, FOURK_BUF) != 0) {
    // error setting subject
}
```

18.1.2.14 function wc_SetDatesBuffer

```
WOLFSSL_API int wc_SetDatesBuffer(
    Cert * ,
    const byte * ,
```

```
    int
)
```

This function sets the dates for a certificate from the date range in the provided der buffer. This method is used to set fields prior to signing.

Parameters:

- **cert** pointer to the cert for which to set the dates
- **der** pointer to the buffer containing the der formatted certificate from which to grab the date range
- **derSz** size of the buffer containing the der formatted certificate from which to grab the date range

See: [wc_InitCert](#)

Return:

- 0 Returned on successfully setting the dates for the certificate
- MEMORY_E Returned if there is an error allocating memory with XMALLOC
- ASN_PARSE_E Returned if there is an error parsing the cert header file
- ASN_OBJECT_ID_E Returned if there is an error parsing the encryption type from the cert
- ASN_EXPECT_0_E Returned if there is a formatting error in the encryption specification of the cert file
- ASN_BEFORE_DATE_E Returned if the date is before the certificate start date
- ASN_AFTER_DATE_E Returned if the date is after the certificate expiration date
- ASN_BITSTR_E Returned if there is an error parsing a bit string from the certificate
- ECC_CURVE_OID_E Returned if there is an error parsing the ECC key from the certificate
- ASN_UNKNOWN_OID_E Returned if the certificate is using an unknown key object id
- ASN_VERSION_E Returned if the ALLOW_V1_EXTENSIONS option is not defined and the certificate is a V1 or V2 certificate
- BAD_FUNC_ARG Returned if there is an error processing the certificate extension
- ASN_CRIT_EXT_E Returned if an unfamiliar critical extension is encountered in processing the certificate
- ASN_SIG_OID_E Returned if the signature encryption type is not the same as the encryption type of the certificate in the provided file
- ASN_SIG_CONFIRM_E Returned if confirming the certification signature fails
- ASN_NAME_INVALID_E Returned if the certificate's name is not permitted by the CA name constraints
- ASN_NO_SIGNER_E Returned if there is no CA signer to verify the certificate's authenticity

Example

```
Cert myCert;
// initialize myCert
byte* der;
der = (byte*)malloc(FOURK_BUF);
// initialize der
if(wc_SetDatesBuffer(&myCert, der, FOURK_BUF) != 0) {
    // error setting subject
}
```

18.1.2.15 function wc_SetAuthKeyIdFromPublicKey

```
WOLFSSL_API int wc_SetAuthKeyIdFromPublicKey(
    Cert * cert,
    RsaKey * rsaKey,
    ecc_key * eckey
```

)

Set AKID from either an RSA or ECC public key. note: Only set one of rsakey or eckey, not both.

Parameters:

- **cert** Pointer to the certificate to set the SKID.
- **rsakey** Pointer to the RsaKey struct to read from.
- **eckey** Pointer to the ecc_key to read from.

See:

- [wc_SetSubjectKeyId](#)
- [wc_SetAuthKeyId](#)
- [wc_SetAuthKeyIdFromCert](#)

Return:

- 0 Success
- BAD_FUNC_ARG Either cert is null or both rsakey and eckey are null.
- MEMORY_E Error allocating memory.
- PUBLIC_KEY_E Error writing to the key.

Example

```
Cert myCert;  
RsaKey keypub;
```

```
wc_InitRsaKey(&keypub, 0);
```

```
if (wc_SetAuthKeyIdFromPublicKey(&myCert, &keypub, NULL) != 0)  
{  
    // Handle error  
}
```

18.1.2.16 function wc_SetAuthKeyIdFromCert

```
WOLFSSL_API int wc_SetAuthKeyIdFromCert(  
    Cert * cert,  
    const byte * der,  
    int derSz  
)
```

Set AKID from from DER encoded certificate.

Parameters:

- **cert** The Cert struct to write to.
- **der** The DER encoded certificate buffer.
- **derSz** Size of der in bytes.

See:

- [wc_SetAuthKeyIdFromPublicKey](#)
- [wc_SetAuthKeyId](#)

Return:

- 0 Success
- BAD_FUNC_ARG Error if any argument is null or derSz is less than 0.
- MEMORY_E Error if problem allocating memory.
- ASN_NO_SKID No subject key ID found.

Example

```
Cert some_cert;
byte some_der[] = { // Initialize a DER buffer };
wc_InitCert(&some_cert);
if(wc_SetAuthKeyIdFromCert(&some_cert, some_der, sizeof(some_der) != 0)
{
    // Handle error
}
```

18.1.2.17 function wc_SetAuthKeyId

```
WOLFSSL_API int wc_SetAuthKeyId(
    Cert * cert,
    const char * file
)
```

Set AKID from certificate file in PEM format.

Parameters:

- **cert** Cert struct you want to set the AKID of.
- **file** Buffer containing PEM cert file.

See:

- [wc_SetAuthKeyIdFromPublicKey](#)
- [wc_SetAuthKeyIdFromCert](#)

Return:

- 0 Success
- BAD_FUNC_ARG Error if cert or file is null.
- MEMORY_E Error if problem allocating memory.

Example

```
char* file_name = "/path/to/file";
cert some_cert;
wc_InitCert(&some_cert);

if(wc_SetAuthKeyId(&some_cert, file_name) != 0)
{
    // Handle Error
}
```

18.1.2.18 function wc_SetSubjectKeyIdFromPublicKey

```
WOLFSSL_API int wc_SetSubjectKeyIdFromPublicKey(
    Cert * cert,
    RsaKey * rsakey,
    ecc_key * eckey
)
```

Set SKID from RSA or ECC public key.

Parameters:

- **cert** Pointer to a Cert structure to be used.
- **rsakey** Pointer to an RsaKey structure
- **eckey** Pointer to an ecc_key structure

See: [wc_SetSubjectKeyId](#)

Return:

- 0 Success
- BAD_FUNC_ARG Returned if cert or rsaKey and eckey is null.
- MEMORY_E Returned if there is an error allocating memory.
- PUBLIC_KEY_E Returned if there is an error getting the public key.

Example

```
Cert some_cert;  
RsaKey some_key;  
wc_InitCert(&some_cert);  
wc_InitRsaKey(&some_key);  
  
if(wc_SetSubjectKeyIdFromPublicKey(&some_cert,&some_key, NULL) != 0)  
{  
    // Handle Error  
}
```

18.1.2.19 function wc_SetSubjectKeyId

```
WOLFSSL_API int wc_SetSubjectKeyId(  
    Cert * cert,  
    const char * file  
)
```

Set SKID from public key file in PEM format. Both arguments are required.

Parameters:

- **cert** Cert structure to set the SKID of.
- **file** Contains the PEM encoded file.

See: [wc_SetSubjectKeyIdFromPublicKey](#)

Return:

- 0 Success
- BAD_FUNC_ARG Returns if cert or file is null.
- MEMORY_E Returns if there is a problem allocating memory for key.
- PUBLIC_KEY_E Returns if there is an error decoding the public key.

Example

```
const char* file_name = "path/to/file";  
Cert some_cert;  
wc_InitCert(&some_cert);  
  
if(wc_SetSubjectKeyId(&some_cert, file_name) != 0)  
{  
    // Handle Error  
}
```

18.1.2.20 function wc_PemPubKeyToDer

```
WOLFSSL_API int wc_PemPubKeyToDer(  
    const char * fileName,  
    unsigned char * derBuf,
```

```
    int derSz
)
```

Loads a PEM key from a file and converts to a DER encoded buffer.

Parameters:

- **fileName** Name of the file to load.
- **derBuf** Buffer for DER encoded key.
- **derSz** Size of DER buffer.

See: [wc_PubKeyPemToDer](#)

Return:

- 0 Success
- <0 Error
- SSL_BAD_FILE There is a problem with opening the file.
- MEMORY_E There is an error allocating memory for the file buffer.
- BUFFER_E derBuf is not large enough to hold the converted key.

Example

```
char* some_file = "filename";
unsigned char der[];

if(wc_PemPubKeyToDer(some_file, der, sizeof(der)) != 0)
{
    //Handle Error
}
```

18.1.2.21 function wc_PubKeyPemToDer

```
WOLFSSL_API int wc_PubKeyPemToDer(
    const unsigned char * ,
    int ,
    unsigned char * ,
    int
)
```

Convert a PEM encoded public key to DER. Returns the number of bytes written to the buffer or a negative value for an error.

Parameters:

- **pem** PEM encoded key
- **pemSz** Size of pem
- **buff** Pointer to buffer for output.
- **buffSz** Size of buffer.

See: [wc_PemPubKeyToDer](#)

Return:

- 0 Success, number of bytes written.
- BAD_FUNC_ARG Returns if pem, buff, or buffSz are null
- <0 An error occurred in the function.

Example

```

byte some_pem[] = { Initialize with PEM key }
unsigned char out_buffer[1024]; // Ensure buffer is large enough to fit DER

if(wc_PubKeyPemToDer(some_pem, sizeof(some_pem), out_buffer,
sizeof(out_buffer)) < 0)
{
    // Handle error
}

```

18.1.2.22 function wc_PemCertToDer

```

WOLFSSL_API int wc_PemCertToDer(
    const char * fileName,
    unsigned char * derBuf,
    int derSz
)

```

This function converts a pem certificate to a der certificate, and places the resulting certificate in the derBuf buffer provided.

Parameters:

- **fileName** path to the file containing a pem certificate to convert to a der certificate
- **derBuf** pointer to a char buffer in which to store the converted certificate
- **derSz** size of the char buffer in which to store the converted certificate

See: none

Return:

- Success On success returns the size of the derBuf generated
- BUFFER_E Returned if the size of derBuf is too small to hold the certificate generated
- MEMORY_E Returned if the call to XMALLOC fails

Example

```

char * file = "../certs/client-cert.pem";
int derSz;
byte * der = (byte*)XMALLOC(EIGHTK_BUF, NULL, DYNAMIC_TYPE_CERT);

derSz = wc_PemCertToDer(file, der, EIGHTK_BUF);
if(derSz <= 0) {
    //PemCertToDer error
}

```

18.1.2.23 function wc_DerToPem

```

WOLFSSL_API int wc_DerToPem(
    const byte * der,
    word32 derSz,
    byte * output,
    word32 outputSz,
    int type
)

```

This function converts a der formatted input certificate, contained in the der buffer, into a pem formatted output certificate, contained in the output buffer. It should be noted that this is not an in place conversion, and a separate buffer must be utilized to store the pem formatted output.

Parameters:

- **der** pointer to the buffer of the certificate to convert
- **derSz** size of the the certificate to convert
- **output** pointer to the buffer in which to store the pem formatted certificate
- **outSz** size of the buffer in which to store the pem formatted certificate
- **type** the type of certificate to generate. Valid types are: CERT_TYPE, PRIVATEKEY_TYPE, ECC_PRIVATEKEY_TYPE, and CERTREQ_TYPE.

See: [wc_PemCertToDer](#)

Return:

- Success On successfully making a pem certificate from the input der cert, returns the size of the pem cert generated.
- BAD_FUNC_ARG Returned if there is an error parsing the der file and storing it as a pem file
- MEMORY_E Returned if there is an error allocating memory with XMALLOC
- ASN_INPUT_E Returned in the case of a base64 encoding error
- BUFFER_E May be returned if the output buffer is too small to store the pem formatted certificate

Example

```
byte* der;
// initialize der with certificate
byte* pemFormatted[FOURK_BUF];

word32 pemSz;
pemSz = wc_DerToPem(der, derSz, pemFormatted, FOURK_BUF, CERT_TYPE);
```

18.1.2.24 function wc_DerToPemEx

```
WOLFSSL_API int wc_DerToPemEx(
    const byte * der,
    word32 derSz,
    byte * output,
    word32 outputSz,
    byte * cipherIno,
    int type
)
```

This function converts a der formatted input certificate, contained in the der buffer, into a pem formatted output certificate, contained in the output buffer. It should be noted that this is not an in place conversion, and a separate buffer must be utilized to store the pem formatted output. Allows setting cipher info.

Parameters:

- **der** pointer to the buffer of the certificate to convert
- **derSz** size of the the certificate to convert
- **output** pointer to the buffer in which to store the pem formatted certificate
- **outSz** size of the buffer in which to store the pem formatted certificate
- **cipher_inf** Additional cipher information.
- **type** the type of certificate to generate. Valid types are: CERT_TYPE, PRIVATEKEY_TYPE, ECC_PRIVATEKEY_TYPE, and CERTREQ_TYPE.

See: [wc_PemCertToDer](#)

Return:

- Success On successfully making a pem certificate from the input der cert, returns the size of the pem cert generated.
- BAD_FUNC_ARG Returned if there is an error parsing the der file and storing it as a pem file
- MEMORY_E Returned if there is an error allocating memory with XMALLOC
- ASN_INPUT_E Returned in the case of a base64 encoding error
- BUFFER_E May be returned if the output buffer is too small to store the pem formatted certificate

Example

```
byte* der;
// initialize der with certificate
byte* pemFormatted[FOURK_BUF];

word32 pemSz;
byte* cipher_info[] { Additional cipher info. }
pemSz = wc_DerToPemEx(der, derSz, pemFormatted, FOURK_BUF, , CERT_TYPE);
```

18.1.2.25 function wc_EccPrivateKeyDecode

```
WOLFSSL_API int wc_EccPrivateKeyDecode(
    const byte *,
    word32 *,
    ecc_key *,
    word32
)
```

This function reads in an ECC private key from the input buffer, input, parses the private key, and uses it to generate an ecc_key object, which it stores in key.

Parameters:

- **input** pointer to the buffer containing the input private key
- **inOutIdx** pointer to a word32 object containing the index in the buffer at which to start
- **key** pointer to an initialized ecc object, on which to store the decoded private key
- **inSz** size of the input buffer containing the private key

See: wc_RSA_PrivateKeyDecode

Return:

- 0 On successfully decoding the private key and storing the result in the ecc_key struct
- ASN_PARSE_E: Returned if there is an error parsing the der file and storing it as a pem file
- MEMORY_E Returned if there is an error allocating memory with XMALLOC
- BUFFER_E Returned if the certificate to convert is large than the specified max certificate size
- ASN_OBJECT_ID_E Returned if the certificate encoding has an invalid object id
- ECC_CURVE_OID_E Returned if the ECC curve of the provided key is not supported
- ECC_BAD_ARG_E Returned if there is an error in the ECC key format
- NOT_COMPILED_IN Returned if the private key is compressed, and no compression key is provided
- MP_MEM Returned if there is an error in the math library used while parsing the private key
- MP_VAL Returned if there is an error in the math library used while parsing the private key
- MP_RANGE Returned if there is an error in the math library used while parsing the private key

Example

```
int ret, idx=0;
ecc_key key; // to store key in

byte* tmp; // tmp buffer to read key from
```

```

tmp = (byte*) malloc(FOURK_BUF);

int inSz;
inSz = fread(tmp, 1, FOURK_BUF, privateKeyFile);
// read key into tmp buffer

wc_ecc_init(&key); // initialize key
ret = wc_EccPrivateKeyDecode(tmp, &idx, &key, (word32)inSz);
if(ret < 0) {
    // error decoding ecc key
}

```

18.1.2.26 function wc_EccKeyToDer

```

WOLFSSL_API int wc_EccKeyToDer(
    ecc_key * ,
    byte * output,
    word32 inLen
)

```

This function writes a private ECC key to der format.

Parameters:

- **key** pointer to the buffer containing the input ecc key
- **output** pointer to a buffer in which to store the der formatted key
- **inLen** the length of the buffer in which to store the der formatted key

See: [wc_RsaKeyToDer](#)

Return:

- Success On successfully writing the ECC key to der format, returns the length written to the buffer
- BAD_FUNC_ARG Returned if key or output is null, or inLen equals zero
- MEMORY_E Returned if there is an error allocating memory with XMALLOC
- BUFFER_E Returned if the converted certificate is too large to store in the output buffer
- ASN_UNKNOWN_OID_E Returned if the ECC key used is of an unknown type
- MP_MEM Returned if there is an error in the math library used while parsing the private key
- MP_VAL Returned if there is an error in the math library used while parsing the private key
- MP_RANGE Returned if there is an error in the math library used while parsing the private key

Example

```

int derSz;
ecc_key key;
// initialize and make key
byte der[FOURK_BUF];
// store der formatted key here

derSz = wc_EccKeyToDer(&key, der, FOURK_BUF);
if(derSz < 0) {
    // error converting ecc key to der buffer
}

```

18.1.2.27 function wc_EccPublicKeyDecode

```

WOLFSSL_API int wc_EccPublicKeyDecode(
    const byte * ,

```

```

    word32 * ,
    ecc_key * ,
    word32
)

```

Decodes an ECC public key from an input buffer. It will parse an ASN sequence to retrieve the ECC key.

Parameters:

- **input** Buffer containing DER encoded key to decode.
- **inOutIdx** Index to start reading input buffer from. On output, index is set to last position parsed of input buffer.
- **key** Pointer to ecc_key struct to store the public key.
- **inSz** Size of the input buffer.

See: [wc_ecc_import_x963](#)

Return:

- 0 Success
- BAD_FUNC_ARG Returns if any arguments are null.
- ASN_PARSE_E Returns if there is an error parsing
- ASN_ECC_KEY_E Returns if there is an error importing the key. See wc_ecc_import_x963 for possible reasons.

Example

```

int ret;
word32 idx = 0;
byte buff[] = { // initialize with key };
ecc_key pubKey;
wc_ecc_init(&pubKey);
if ( wc_EccPublicKeyDecode(buff, &idx, &pubKey, sizeof(buff)) != 0) {
    // error decoding key
}

```

18.1.2.28 function wc_EccPublicKeyToDer

```

WOLFSSL_API int wc_EccPublicKeyToDer(
    ecc_key * ,
    byte * output,
    word32 inLen,
    int with_AlgCurve
)

```

This function converts the ECC public key to DER format. It returns the size of buffer used. The public ECC key in DER format is stored in output buffer. with_AlgCurve is a flag for when to include a header that has the Algorithm and Curve information.

Parameters:

- **key** Pointer to ECC key
- **output** Pointer to output buffer to write to.
- **inLen** Size of buffer.
- **with_AlgCurve** a flag for when to include a header that has the Algorithm and Curve information.

See:

- [wc_EccKeyToDer](#)
- [wc_EccPrivateKeyDecode](#)

Return:

- 0 Success, size of buffer used
- BAD_FUNC_ARG Returned if output or key is null.
- LENGTH_ONLY_E Error in getting ECC public key size.
- BUFFER_E Returned when output buffer is too small.

Example

```
ecc_key key;
wc_ecc_init(&key);
WC_WC_RNG rng;
wc_InitRng(&rng);
wc_ecc_make_key(&rng, 24, &key);
int derSz = // Some appropriate size for der;
byte der[derSz];

if(wc_EccPublicKeyToDer(&key, der, derSz, 1) < 0)
{
    // Error converting ECC public key to der
}
```

18.1.2.29 function wc_EncodeSignature

```
WOLFSSL_API word32 wc_EncodeSignature(
    byte * out,
    const byte * digest,
    word32 digSz,
    int hashOID
)
```

This function encodes a digital signature into the output buffer, and returns the size of the encoded signature created.

Parameters:

- **out** pointer to the buffer where the encoded signature will be written
- **digest** pointer to the digest to use to encode the signature
- **digSz** the length of the buffer containing the digest
- **hashOID** OID identifying the hash type used to generate the signature. Valid options, depending on build configurations, are: SHAh, SHA256h, SHA384h, SHA512h, MD2h, MD5h, DESb, DES3b, CTC_MD5wRSA, CTC_SHAwRSA, CTC_SHA256wRSA, CTC_SHA384wRSA, CTC_SHA512wRSA, CTC_SHAwECDSA, CTC_SHA256wECDSA, CTC_SHA384wECDSA, and CTC_SHA512wECDSA.

See: none

Return: Success On successfully writing the encoded signature to output, returns the length written to the buffer

```
int signSz;
byte encodedSig[MAX_ENCODED_SIG_SZ];
Sha256 sha256;
// initialize sha256 for hashing

byte* dig = (byte*)malloc(SHA256_DIGEST_SIZE);
// perform hashing and hash updating so dig stores SHA-256 hash
```

```
// (see wc_InitSha256, wc_Sha256Update and wc_Sha256Final)
signSz = wc_EncodeSignature(encodedSig, dig, SHA256_DIGEST_SIZE, SHA256h);
```

18.1.2.30 function wc_GetCTC_HashOID

```
WOLFSSL_API int wc_GetCTC_HashOID(
    int type
)
```

This function returns the hash OID that corresponds to a hashing type. For example, when given the type: SHA512, this function returns the identifier corresponding to a SHA512 hash, SHA512h.

Parameters:

- **type** the hash type for which to find the OID. Valid options, depending on build configuration, include: MD2, MD5, SHA, SHA256, SHA512, SHA384, and SHA512.

See: none

Return:

- Success On success, returns the OID corresponding to the appropriate hash to use with that encryption type.
- 0 Returned if an unrecognized hash type is passed in as argument.

Example

```
int hashOID;

hashOID = wc_GetCTC_HashOID(SHA512);
if (hashOID == 0) {
    // WOLFSSL_SHA512 not defined
}
```

18.1.2.31 function wc_SetCert_Free

```
WOLFSSL_API void wc_SetCert_Free(
    Cert * cert
)
```

This function cleans up memory and resources used by the certificate structure's decoded cert cache. When WOLFSSL_CERT_GEN_CACHE is defined the decoded cert structure is cached in the certificate structure. This allows subsequent calls to certificate set functions to avoid parsing the decoded cert on each call.

Parameters:

- **cert** pointer to an uninitialized certificate information structure.

See:

- [wc_SetAuthKeyIdFromCert](#)
- [wc_SetIssuerBuffer](#)
- [wc_SetSubjectBuffer](#)
- [wc_SetSubjectRaw](#)
- [wc_SetIssuerRaw](#)
- [wc_SetAltNamesBuffer](#)
- [wc_SetDatesBuffer](#)

Return:

- 0 on success.

- BAD_FUNC_ARG Returned if invalid pointer is passed in as argument.

Example

```
Cert cert; // Initialized certificate structure

wc_SetCert_Free(&cert);
```

18.1.2.32 function wc_GetPkcs8TraditionalOffset

```
WOLFSSL_API int wc_GetPkcs8TraditionalOffset(
    byte * input,
    word32 * inOutIdx,
    word32 sz
)
```

This function finds the beginning of the traditional private key inside a PKCS#8 unencrypted buffer.

Parameters:

- **input** Buffer containing unencrypted PKCS#8 private key.
- **inOutIdx** Index into the input buffer. On input, it should be a byte offset to the beginning of the the PKCS#8 buffer. On output, it will be the byte offset to the traditional private key within the input buffer.
- **sz** The number of bytes in the input buffer.

See:

- [wc_CreatePKCS8Key](#)
- [wc_EncryptPKCS8Key](#)
- [wc_DecryptPKCS8Key](#)
- [wc_CreateEncryptedPKCS8Key](#)

Return:

- Length of traditional private key on success.
- Negative values on failure.

Example

```
byte* pkcs8Buf; // Buffer containing PKCS#8 key.
word32 idx = 0;
word32 sz; // Size of pkcs8Buf.
...
ret = wc_GetPkcs8TraditionalOffset(pkcs8Buf, &idx, sz);
// pkcs8Buf + idx is now the beginning of the traditional private key bytes.
```

18.1.2.33 function wc_CreatePKCS8Key

```
WOLFSSL_API int wc_CreatePKCS8Key(
    byte * out,
    word32 * outSz,
    byte * key,
    word32 keySz,
    int algoID,
    const byte * curveOID,
    word32 oidSz
)
```

This function takes in a DER private key and converts it to PKCS#8 format. Also used in creating PKCS#12 shrouded key bags. See RFC 5208.

Parameters:

- **out** Buffer to place result in. If NULL, required out buffer size returned in outSz.
- **outSz** Size of out buffer.
- **key** Buffer with traditional DER key.
- **keySz** Size of key buffer.
- **algoID** Algorithm ID (e.g. RSAk).
- **curveOID** ECC curve OID if used. Should be NULL for RSA keys.
- **oidSz** Size of curve OID. Is set to 0 if curveOID is NULL.

See:

- [wc_GetPkcs8TraditionalOffset](#)
- [wc_EncryptPKCS8Key](#)
- [wc_DecryptPKCS8Key](#)
- [wc_CreateEncryptedPKCS8Key](#)

Return:

- The size of the PKCS#8 key placed into out on success.
- LENGTH_ONLY_E if out is NULL, with required output buffer size in outSz.
- Other negative values on failure.

Example

```
ecc_key eccKey;           // wolfSSL ECC key object.
byte* der;                // DER-encoded ECC key.
word32 derSize;           // Size of der.
const byte* curveOid = NULL; // OID of curve used by eccKey.
word32 curveOidSz = 0;    // Size of curve OID.
byte* pkcs8;              // Output buffer for PKCS#8 key.
word32 pkcs8Sz;           // Size of output buffer.

derSize = wc_EccKeyDerSize(&eccKey, 1);
...
derSize = wc_EccKeyToDer(&eccKey, der, derSize);
...
ret = wc_ecc_get_oid(eccKey.dp->oidSum, &curveOid, &curveOidSz);
...
ret = wc_CreatePKCS8Key(NULL, &pkcs8Sz, der,
    derSize, ECDSAk, curveOid, curveOidSz); // Get size needed in pkcs8Sz.
...
ret = wc_CreatePKCS8Key(pkcs8, &pkcs8Sz, der,
    derSize, ECDSAk, curveOid, curveOidSz);
```

18.1.2.34 function `wc_EncryptPKCS8Key`

```
WOLFSSL_API int wc_EncryptPKCS8Key(
    byte * key,
    word32 keySz,
    byte * out,
    word32 * outSz,
    const char * password,
    int passwordSz,
    int vPKCS,
```

```

    int pbeOid,
    int encAlgId,
    byte * salt,
    word32 saltSz,
    int itt,
    WC_RNG * rng,
    void * heap
)

```

This function takes in an unencrypted PKCS#8 DER key (e.g. one created by `wc_CreatePKCS8Key`) and converts it to PKCS#8 encrypted format. The resulting encrypted key can be decrypted using `wc_DecryptPKCS8Key`. See RFC 5208.

Parameters:

- **key** Buffer with traditional DER key.
- **keySz** Size of key buffer.
- **out** Buffer to place result in. If NULL, required out buffer size returned in outSz.
- **outSz** Size of out buffer.
- **password** The password to use for the password-based encryption algorithm.
- **passwordSz** The length of the password (not including the NULL terminator).
- **vPKCS** The PKCS version to use. Can be 1 for PKCS12 or PKCS5.
- **pbeOid** The OID of the PBE scheme to use (e.g. PBES2 or one of the OIDs for PBES1 in RFC 2898 A.3).
- **encAlgId** The encryption algorithm ID to use (e.g. AES256CBCb).
- **salt** The salt buffer to use. If NULL, a random salt will be used.
- **saltSz** The length of the salt buffer. Can be 0 if passing NULL for salt.
- **itt** The number of iterations to use for the KDF.
- **rng** A pointer to an initialized WC_RNG object.
- **heap** A pointer to the heap used for dynamic allocation. Can be NULL.

See:

- [wc_GetPkcs8TraditionalOffset](#)
- [wc_CreatePKCS8Key](#)
- [wc_DecryptPKCS8Key](#)
- [wc_CreateEncryptedPKCS8Key](#)

Return:

- The size of the encrypted key placed in out on success.
- LENGTH_ONLY_E if out is NULL, with required output buffer size in outSz.
- Other negative values on failure.

Example

```

byte* pkcs8;           // Unencrypted PKCS#8 key.
word32 pkcs8Sz;        // Size of pkcs8.
byte* pkcs8Enc;        // Encrypted PKCS#8 key.
word32 pkcs8EncSz;     // Size of pkcs8Enc.
const char* password;  // Password to use for encryption.
int passwordSz;        // Length of password (not including NULL terminator).
WC_RNG rng;

// The following produces an encrypted version of pkcs8 in pkcs8Enc. The
// encryption uses password-based encryption scheme 2 (PBE2) from PKCS#5 and
// the AES cipher in CBC mode with a 256-bit key. See RFC 8018 for more on
// PKCS#5.
ret = wc_EncryptPKCS8Key(pkcs8, pkcs8Sz, pkcs8Enc, &pkcs8EncSz, password,

```

```
passwordSz, PKCS5, PBES2, AES256CBCb, NULL, 0,
WC_PKCS12_ITT_DEFAULT, &rng, NULL);
```

18.1.2.35 function wc_DecryptPKCS8Key

```
WOLFSSL_API int wc_DecryptPKCS8Key(
    byte * input,
    word32 sz,
    const char * password,
    int passwordSz
)
```

This function takes an encrypted PKCS#8 DER key and decrypts it to PKCS#8 unencrypted DER. Undoes the encryption done by `wc_EncryptPKCS8Key`. See RFC5208. The input buffer is overwritten with the decrypted data.

Parameters:

- **input** On input, buffer containing encrypted PKCS#8 key. On successful output, contains the decrypted key.
- **sz** Size of the input buffer.
- **password** The password used to encrypt the key.
- **passwordSz** The length of the password (not including NULL terminator).

See:

- [wc_GetPkcs8TraditionalOffset](#)
- [wc_CreatePKCS8Key](#)
- [wc_EncryptPKCS8Key](#)
- [wc_CreateEncryptedPKCS8Key](#)

Return:

- The length of the decrypted buffer on success.
- Negative values on failure.

Example

```
byte* pkcs8Enc;           // Encrypted PKCS#8 key made with wc_EncryptPKCS8Key.
word32 pkcs8EncSz;        // Size of pkcs8Enc.
const char* password;     // Password to use for decryption.
int passwordSz;           // Length of password (not including NULL terminator).

ret = wc_DecryptPKCS8Key(pkcs8Enc, pkcs8EncSz, password, passwordSz);
```

18.1.2.36 function wc_CreateEncryptedPKCS8Key

```
WOLFSSL_API int wc_CreateEncryptedPKCS8Key(
    byte * key,
    word32 keySz,
    byte * out,
    word32 * outSz,
    const char * password,
    int passwordSz,
    int vPKCS,
    int pbeOid,
    int encAlgId,
    byte * salt,
    word32 saltSz,
```

```

    int itt,
    WC_RNG * rng,
    void * heap
)

```

This function takes a traditional, DER key, converts it to PKCS#8 format, and encrypts it. It uses `wc_CreatePKCS8Key` and `wc_EncryptPKCS8Key` to do this.

Parameters:

- **key** Buffer with traditional DER key.
- **keySz** Size of key buffer.
- **out** Buffer to place result in. If NULL, required out buffer size returned in outSz.
- **outSz** Size of out buffer.
- **password** The password to use for the password-based encryption algorithm.
- **passwordSz** The length of the password (not including the NULL terminator).
- **vPKCS** The PKCS version to use. Can be 1 for PKCS12 or PKCS5.
- **pbeOid** The OID of the PBE scheme to use (e.g. PBES2 or one of the OIDs for PBES1 in RFC 2898 A.3).
- **encAlgId** The encryption algorithm ID to use (e.g. AES256CBCb).
- **salt** The salt buffer to use. If NULL, a random salt will be used.
- **saltSz** The length of the salt buffer. Can be 0 if passing NULL for salt.
- **itt** The number of iterations to use for the KDF.
- **rng** A pointer to an initialized WC_RNG object.
- **heap** A pointer to the heap used for dynamic allocation. Can be NULL.

See:

- [wc_GetPkcs8TraditionalOffset](#)
- [wc_CreatePKCS8Key](#)
- [wc_EncryptPKCS8Key](#)
- [wc_DecryptPKCS8Key](#)

Return:

- The size of the encrypted key placed in out on success.
- LENGTH_ONLY_E if out is NULL, with required output buffer size in outSz.
- Other negative values on failure.

Example

```

byte* key;           // Traditional private key (DER formatted).
word32 keySz;        // Size of key.
byte* pkcs8Enc;      // Encrypted PKCS#8 key.
word32 pkcs8EncSz;   // Size of pkcs8Enc.
const char* password; // Password to use for encryption.
int passwordSz;      // Length of password (not including NULL terminator).
WC_RNG rng;

// The following produces an encrypted, PKCS#8 version of key in pkcs8Enc.
// The encryption uses password-based encryption scheme 2 (PBE2) from PKCS#5
// and the AES cipher in CBC mode with a 256-bit key. See RFC 8018 for more
// on PKCS#5.
ret = wc_CreateEncryptedPKCS8Key(key, keySz, pkcs8Enc, &pkcs8EncSz,
    password, passwordSz, PKCS5, PBES2, AES256CBCb, NULL, 0,
    WC_PKCS12_ITT_DEFAULT, &rng, NULL);

```

WOLFSSL_API int	Base16_Decode	(const byte * in, word32 inLen, byte * out, word32 * outLen)This function decode
WOLFSSL_API int	Base16_Encode	(const byte * in, word32 inLen, byte * out, word32 * outLen)Encode input to base

18.2.2 Functions Documentation

18.2.2.1 function Base64_Decode

```
WOLFSSL_API int Base64_Decode(  
    const byte * in,  
    word32 inLen,  
    byte * out,  
    word32 * outLen  
)
```

This function decodes the given Base64 encoded input, in, and stores the result in the output buffer out. It also sets the size written to the output buffer in the variable outLen.

Parameters:

- **in** pointer to the input buffer to decode
- **inLen** length of the input buffer to decode
- **out** pointer to the output buffer in which to store the decoded message
- **outLen** pointer to the length of the output buffer. Updated with the bytes written at the end of the function call

See:

- [Base64_Encode](#)
- [Base16_Decode](#)

Return:

- 0 Returned upon successfully decoding the Base64 encoded input
- BAD_FUNC_ARG Returned if the output buffer is too small to store the decoded input
- ASN_INPUT_E Returned if a character in the input buffer falls outside of the Base64 range ([A-Za-z0-9+/=]) or if there is an invalid line ending in the Base64 encoded input

Example

```
byte encoded[] = { // initialize text to decode };  
byte decoded[sizeof(encoded)];  
// requires at least (sizeof(encoded) * 3 + 3) / 4 room  
  
int outLen = sizeof(decoded);  
  
if( Base64_Decode(encoded, sizeof(encoded), decoded, &outLen) != 0 ) {  
    // error decoding input buffer  
}
```

18.2.2.2 function Base64_Encode

```
WOLFSSL_API int Base64_Encode(  
    const byte * in,  
    word32 inLen,  
    byte * out,  
    word32 * outLen  
)
```

This function encodes the given input, in, and stores the Base64 encoded result in the output buffer out. It writes the data with the traditional '' line endings, instead of escaped %0A line endings. Upon successfully completing, this function also sets outLen to the number of bytes written to the output buffer.

Parameters:

- **in** pointer to the input buffer to encode
- **inLen** length of the input buffer to encode
- **out** pointer to the output buffer in which to store the encoded message
- **outLen** pointer to the length of the output buffer in which to store the encoded message

See:

- [Base64_EncodeEsc](#)
- [Base64_Decode](#)

Return:

- 0 Returned upon successfully decoding the Base64 encoded input
- BAD_FUNC_ARG Returned if the output buffer is too small to store the encoded input
- BUFFER_E Returned if the output buffer runs out of room while encoding

Example

```
byte plain[] = { // initialize text to encode };  
byte encoded[MAX_BUFFER_SIZE];  
  
int outLen = sizeof(encoded);  
  
if( Base64_Encode(plain, sizeof(plain), encoded, &outLen) != 0 ) {  
    // error encoding input buffer  
}
```

18.2.2.3 function Base64_EncodeEsc

```
int Base64_EncodeEsc(  
    const byte * in,  
    word32 inLen,  
    byte * out,  
    word32 * outLen  
)
```

This function encodes the given input, in, and stores the Base64 encoded result in the output buffer out. It writes the data with %0A escaped line endings instead of '' line endings. Upon successfully completing, this function also sets outLen to the number of bytes written to the output buffer.

Parameters:

- **in** pointer to the input buffer to encode
- **inLen** length of the input buffer to encode
- **out** pointer to the output buffer in which to store the encoded message

- **outLen** pointer to the length of the output buffer in which to store the encoded message

See:

- [Base64_Encode](#)
- [Base64_Decode](#)

Return:

- 0 Returned upon successfully decoding the Base64 encoded input
- BAD_FUNC_ARG Returned if the output buffer is too small to store the encoded input
- BUFFER_E Returned if the output buffer runs out of room while encoding
- ASN_INPUT_E Returned if there is an error processing the decode on the input message

Example

```
byte plain[] = { // initialize text to encode };
byte encoded[MAX_BUFFER_SIZE];

int outLen = sizeof(encoded);

if( Base64_EncodeEsc(plain, sizeof(plain), encoded, &outLen) != 0 ) {
    // error encoding input buffer
}
```

18.2.2.4 function Base64_Encode_NoNI

```
WOLFSSL_API int Base64_Encode_NoNI(
    const byte * in,
    word32 inLen,
    byte * out,
    word32 * outLen
)
```

This function encodes the given input, in, and stores the Base64 encoded result in the output buffer out. It writes the data with no new lines. Upon successfully completing, this function also sets outLen to the number of bytes written to the output buffer.

Parameters:

- **in** pointer to the input buffer to encode
- **inLen** length of the input buffer to encode
- **out** pointer to the output buffer in which to store the encoded message
- **outLen** pointer to the length of the output buffer in which to store the encoded message

See:

- [Base64_Encode](#)
- [Base64_Decode](#)

Return:

- 0 Returned upon successfully decoding the Base64 encoded input
- BAD_FUNC_ARG Returned if the output buffer is too small to store the encoded input
- BUFFER_E Returned if the output buffer runs out of room while encoding
- ASN_INPUT_E Returned if there is an error processing the decode on the input message

Example

```
byte plain[] = { // initialize text to encode };
byte encoded[MAX_BUFFER_SIZE];
int outLen = sizeof(encoded);
```

```

if( Base64_Encode_NoNl(plain, sizeof(plain), encoded, &outLen) != 0 ) {
    // error encoding input buffer
}

```

18.2.2.5 function Base16_Decode

```

WOLFSSL_API int Base16_Decode(
    const byte * in,
    word32 inLen,
    byte * out,
    word32 * outLen
)

```

This function decodes the given Base16 encoded input, in, and stores the result in the output buffer out. It also sets the size written to the output buffer in the variable outLen.

Parameters:

- **in** pointer to the input buffer to decode
- **inLen** length of the input buffer to decode
- **out** pointer to the output buffer in which to store the decoded message
- **outLen** pointer to the length of the output buffer. Updated with the bytes written at the end of the function call

See:

- [Base64_Encode](#)
- [Base64_Decode](#)
- [Base16_Encode](#)

Return:

- 0 Returned upon successfully decoding the Base16 encoded input
- BAD_FUNC_ARG Returned if the output buffer is too small to store the decoded input or if the input length is not a multiple of two
- ASN_INPUT_E Returned if a character in the input buffer falls outside of the Base16 range ([0-9A-F])

Example

```

byte encoded[] = { // initialize text to decode };
byte decoded[sizeof(encoded)];
int outLen = sizeof(decoded);

if( Base16_Decode(encoded, sizeof(encoded), decoded, &outLen) != 0 ) {
    // error decoding input buffer
}

```

18.2.2.6 function Base16_Encode

```

WOLFSSL_API int Base16_Encode(
    const byte * in,
    word32 inLen,
    byte * out,
    word32 * outLen
)

```

Encode input to base16 output.

Parameters:

- **in** Pointer to input buffer to be encoded.
- **inLen** Length of input buffer.
- **out** Pointer to output buffer.
- **outLen** Length of output buffer. Is set to len of encoded output.

See:

- [Base64_Encode](#)
- [Base64_Decode](#)
- [Base16_Decode](#)

Return:

- 0 Success
- BAD_FUNC_ARG Returns if in, out, or outLen is null or if outLen is less than 2 times inLen plus 1.

Example

```
byte in[] = { // Contents of something to be encoded };
byte out[NECESSARY_OUTPUT_SIZE];
word32 outSz = sizeof(out);

if(Base16_Encode(in, sizeof(in), out, &outSz) != 0)
{
    // Handle encode error
}
```

18.3 Compression

18.3.1 Functions

	Name	
WOLFSSL_API int	wc_Compress (byte *, word32, const byte *, word32, word32)	This function compresses the given input data using Huffman coding and stores the output in out.
WOLFSSL_API int	wc_DeCompress (byte *, word32, const byte *, word32)	This function decompresses the given compressed data and stores the output in out.

18.3.2 Functions Documentation

18.3.2.1 function wc_Compress

```
WOLFSSL_API int wc_Compress(
    byte *,
    word32,
    const byte *,
    word32,
    word32
)
```

This function compresses the given input data using Huffman coding and stores the output in out. Note that the output buffer should still be larger than the input buffer because there exists a certain input for which there will be no compression possible, which will still require a lookup table. It is recommended that one allocate $\text{srcSz} + 0.1\% + 12$ for the output buffer.

Parameters:

- **out** pointer to the output buffer in which to store the compressed data
- **outSz** size available in the output buffer for storage
- **in** pointer to the buffer containing the message to compress
- **inSz** size of the input message to compress

- **flags** flags to control how compression operates. Use 0 for normal decompression

See: [wc_DeCompress](#)

Return:

- On successfully compressing the input data, returns the number of bytes stored in the output buffer
- COMPRESS_INIT_E Returned if there is an error initializing the stream for compression
- COMPRESS_E Returned if an error occurs during compression

Example

```
byte message[] = { // initialize text to compress };
byte compressed[(sizeof(message) + sizeof(message) * .001 + 12 )];
// Recommends at least srcSz + .1% + 12

if( wc_Compress(compressed, sizeof(compressed), message, sizeof(message),
0) != 0){
    // error compressing data
}
```

18.3.2.2 function wc_DeCompress

```
WOLFSSL_API int wc_DeCompress(
    byte * ,
    word32 ,
    const byte * ,
    word32
)
```

This function decompresses the given compressed data using Huffman coding and stores the output in out.

Parameters:

- **out** pointer to the output buffer in which to store the decompressed data
- **outSz** size available in the output buffer for storage
- **in** pointer to the buffer containing the message to decompress
- **inSz** size of the input message to decompress

See: [wc_Compress](#)

Return:

- Success On successfully decompressing the input data, returns the number of bytes stored in the output buffer
- COMPRESS_INIT_E: Returned if there is an error initializing the stream for compression
- COMPRESS_E: Returned if an error occurs during compression

Example

```
byte compressed[] = { // initialize compressed message };
byte decompressed[MAX_MESSAGE_SIZE];

if( wc_DeCompress(decompressed, sizeof(decompressed),
compressed, sizeof(compressed)) != 0 ) {
    // error decompressing data
}
```

18.4 Error Reporting

18.4.1 Functions

	Name
WOLFSSL_API void	wc_ErrorString (int err, char * buff)This function stores the error string for a particular error
WOLFSSL_API const char *	wc_GetErrorString (int error)This function returns the error string for a particular error

18.4.2 Functions Documentation

18.4.2.1 function wc_ErrorString

```
WOLFSSL_API void wc_ErrorString(  
    int err,  
    char * buff  
)
```

This function stores the error string for a particular error code in the given buffer.

Parameters:

- **error** error code for which to get the string
- **buffer** buffer in which to store the error string. Buffer should be at least WOLFSSL_MAX_ERROR_SZ (80 bytes) long

See: [wc_GetErrorString](#)

Return: none No returns.

Example

```
char errorMsg[WOLFSSL_MAX_ERROR_SZ];  
int err = wc_some_function();  
  
if( err != 0) { // error occurred  
    wc_ErrorString(err, errorMsg);  
}
```

18.4.2.2 function wc_GetErrorString

```
WOLFSSL_API const char * wc_GetErrorString(  
    int error  
)
```

This function returns the error string for a particular error code.

Parameters:

- **error** error code for which to get the string

See: [wc_ErrorString](#)

Return: string Returns the error string for an error code as a string literal.

Example

```
char * errorMsg;  
int err = wc_some_function();  
  
if( err != 0) { // error occurred
```

```

    errorMsg = wc_GetErrorString(err);
}

```

18.5 IoT-Safe Module

18.5.2 Detailed Description

IoT-Safe (IoT-SIM Applet For Secure End-2-End Communication) is a technology that leverage the SIM as robust, scalable and standardized hardware Root of Trust to protect data communication.

IoT-Safe SSL sessions use the SIM as Hardware Security Module, offloading all the crypto public key operations and reducing the attack surface by restricting access to certificate and keys to the SIM.

IoT-Safe support can be enabled on an existing WOLFSSL_CTX contex, using **wolfSSL_CTX_iotsafe_enable()**.

Session created within the context can set the parameters for IoT-Safe key and files usage, and enable the public keys callback, with **wolfSSL_iotsafe_on()**.

If compiled in, the module supports IoT-Safe random number generator as source of entropy for wolfCrypt.

18.5.3 Functions Documentation

18.5.3.1 function wolfSSL_CTX_iotsafe_enable

```

WOLFSSL_API int wolfSSL_CTX_iotsafe_enable(
    WOLFSSL_CTX * ctx
)

```

This function enables the IoT-Safe support on the given context.

Parameters:

- **ctx** pointer to the WOLFSSL_CTX object on which the IoT-safe support must be enabled

See:

- **wolfSSL_iotsafe_on**
- **wolfIoTSafe_SetCSIM_read_cb**
- **wolfIoTSafe_SetCSIM_write_cb**

Return:

- 0 on success
- WC_HW_E on hardware error

Example

```
WOLFSSL_CTX *ctx;
ctx = wolfSSL_CTX_new(wolfTLSv1_2_client_method());
if (!ctx)
    return NULL;
wolfSSL_CTX_iotsafe_enable(ctx);
```

18.5.3.2 function wolfSSL_iotsafe_on

```
WOLFSSL_API int wolfSSL_iotsafe_on(
    WOLFSSL * ssl,
    byte privkey_id,
    byte ecdh_keypair_slot,
    byte peer_pubkey_slot,
    byte peer_cert_slot
)
```

This function connects the IoT-Safe TLS callbacks to the given SSL session.

Parameters:

- **ssl** pointer to the WOLFSSL object where the callbacks will be enabled
- **privkey_id** id of the iot-safe applet slot containing the private key for the host
- **ecdh_keypair_slot** id of the iot-safe applet slot to store the ECDH keypair
- **peer_pubkey_slot** id of the iot-safe applet slot to store the other endpoint's public key for ECDH
- **peer_cert_slot** id of the iot-safe applet slot to store the other endpoint's public key for verification

See: [wolfSSL_CTX_iotsafe_enable](#)

Return:

- 0 upon success
- NOT_COMPILED_IN if HAVE_PK_CALLBACKS is disabled
- BAD_FUNC_ARG if the ssl pointer is invalid

Example

```
// Define key ids for IoT-Safe
#define PRIVKEY_ID 0x02
#define ECDH_KEYPAIR_ID 0x03
#define PEER_PUBKEY_ID 0x04
#define PEER_CERT_ID 0x05
// Create new ssl session
WOLFSSL *ssl;
ssl = wolfSSL_new(ctx);
if (!ssl)
    return NULL;
// Enable IoT-Safe and associate key slots
ret = wolfSSL_CTX_iotsafe_on(ssl, PRIVKEY_ID, ECDH_KEYPAIR_ID, PEER_PUBKEY_ID, PEER_CERT_ID)
```

18.5.3.3 function wolfIoTSafe_SetCSIM_read_cb

```
WOLFSSL_API void wolfIoTSafe_SetCSIM_read_cb(
    wolfSSL_IOTSafe_CSIM_read_cb rf
```

)

Associates a read callback for the AT+CSIM commands. This input function is usually associated to a read event of a UART channel communicating with the modem. The read callback associated is global and changes for all the contexts that use IoT-safe support at the same time.

Parameters:

- **rf** Read callback associated to a UART read event. The callback function takes two arguments (buf, len) and return the number of characters read, up to len. When a newline is encountered, the callback should return the number of characters received so far, including the newline character.

See: [wolfIoTSafe_SetCSIM_write_cb](#)

Example

```
// USART read function, defined elsewhere
int usart_read(char *buf, int len);

wolfIoTSafe_SetCSIM_read_cb(usart_read);
```

18.5.3.4 function `wolfIoTSafe_SetCSIM_write_cb`

```
WOLFSSL_API void wolfIoTSafe_SetCSIM_write_cb(
    wolfSSL_IOTSafe_CSIM_write_cb wf
)
```

Associates a write callback for the AT+CSIM commands. This output function is usually associated to a write event on a UART channel communicating with the modem. The write callback associated is global and changes for all the contexts that use IoT-safe support at the same time.

Parameters:

- **rf** Write callback associated to a UART write event. The callback function takes two arguments (buf, len) and return the number of characters written, up to len.

See: [wolfIoTSafe_SetCSIM_read_cb](#)

Example

```
// USART write function, defined elsewhere
int usart_write(const char *buf, int len);
wolfIoTSafe_SetCSIM_write_cb(usart_write);
```

18.5.3.5 function `wolfIoTSafe_GetRandom`

```
WOLFSSL_API int wolfIoTSafe_GetRandom(
    unsigned char * out,
    word32 sz
)
```

Generate a random buffer of given size, using the IoT-Safe function `GetRandom`. This function is automatically used by the `wolfCrypt` RNG object.

Parameters:

- **out** the buffer where the random sequence of bytes is stored.
- **sz** the size of the random sequence to generate, in bytes

Return: 0 upon success

18.5.3.6 function wolfIoTSafe_GetCert

```
WOLFSSL_API int wolfIoTSafe_GetCert(  
    uint8_t id,  
    unsigned char * output,  
    unsigned long sz  
)
```

Import a certificate stored in a file on IoT-Safe applet, and store it locally in memory.

Parameters:

- **id** The file id in the IoT-Safe applet where the certificate is stored
- **output** the buffer where the certificate will be imported
- **sz** the maximum size available in the buffer output

Return:

- the length of the certificate imported
- < 0 in case of failure

Example

```
#define CRT_CLIENT_FILE_ID 0x03  
unsigned char cert_buffer[2048];  
// Get the certificate into the buffer  
cert_buffer_size = wolfIoTSafe_GetCert(CRT_CLIENT_FILE_ID, cert_buffer, 2048);  
if (cert_buffer_size < 1) {  
    printf("Bad cli cert\n");  
    return -1;  
}  
printf("Loaded Client certificate from IoT-Safe, size = %lu\n", cert_buffer_size);  
  
// Use the certificate buffer as identity for the TLS client context  
if (wolfSSL_CTX_use_certificate_buffer(cli_ctx, cert_buffer,  
    cert_buffer_size, SSL_FILETYPE_ASN1) != SSL_SUCCESS) {  
    printf("Cannot load client cert\n");  
    return -1;  
}  
printf("Client certificate successfully imported.\n");
```

18.5.3.7 function wc_iotsafe_ecc_import_public

```
WOLFSSL_API int wc_iotsafe_ecc_import_public(  
    ecc_key * key,  
    byte key_id  
)
```

Import an ECC 256-bit public key, stored in the IoT-Safe applet, into an ecc_key object.

Parameters:

- **key** the ecc_key object that will contain the key imported from the IoT-Safe applet
- **id** The key id in the IoT-Safe applet where the public key is stored

See:

- [wc_iotsafe_ecc_export_public](#)
- [wc_iotsafe_ecc_export_private](#)

Return:

- 0 upon success
- < 0 in case of failure

18.5.3.8 function `wc_iotsafe_ecc_export_public`

```
WOLFSSL_API int wc_iotsafe_ecc_export_public(
    ecc_key * key,
    byte key_id
)
```

Export an ECC 256-bit public key, from `ecc_key` object to a writable public-key slot into the IoT-Safe applet.

Parameters:

- **key** the `ecc_key` object containing the key to be exported
- **id** The key id in the IoT-Safe applet where the public key will be stored

See:

- [wc_iotsafe_ecc_import_public](#)
- [wc_iotsafe_ecc_export_private](#)

Return:

- 0 upon success
- < 0 in case of failure

18.5.3.9 function `wc_iotsafe_ecc_export_private`

```
WOLFSSL_API int wc_iotsafe_ecc_export_private(
    ecc_key * key,
    byte key_id
)
```

Export an ECC 256-bit key, from `ecc_key` object to a writable private-key slot into the IoT-Safe applet.

Parameters:

- **key** the `ecc_key` object containing the key to be exported
- **id** The key id in the IoT-Safe applet where the private key will be stored

See:

- [wc_iotsafe_ecc_import_public](#)
- [wc_iotsafe_ecc_export_public](#)

Return:

- 0 upon success
- < 0 in case of failure

18.5.3.10 function `wc_iotsafe_ecc_sign_hash`

```
WOLFSSL_API int wc_iotsafe_ecc_sign_hash(
    byte * in,
    word32 inlen,
    byte * out,
    word32 * outlen,
    byte key_id
)
```

Sign a pre-computed 256-bit HASH, using a private key previously stored, or pre-provisioned, in the IoT-Safe applet.

Parameters:

- **in** pointer to the buffer containing the message hash to sign
- **inlen** length of the message hash to sign
- **out** buffer in which to store the generated signature
- **outlen** max length of the output buffer. Will store the bytes
- **id** key id in the IoT-Safe applet for the slot containing the private key to sign the payload written to out upon successfully generating a message signature

See:

- [wc_iotsafe_ecc_verify_hash](#)
- [wc_iotsafe_ecc_gen_k](#)

Return:

- 0 upon success
- < 0 in case of failure

18.5.3.11 function `wc_iotsafe_ecc_gen_k`

```
WOLFSSL_API int wc_iotsafe_ecc_gen_k(  
    byte key_id  
)
```

Generate an ECC 256-bit keypair and store it in a (writable) slot into the IoT-Safe applet.

Parameters:

- **key_id** The id of the slot where the ECC key pair is stored in the IoT-Safe applet.

See:

- [wc_iotsafe_ecc_sign_hash](#)
- [wc_iotsafe_ecc_verify_hash](#)

Return:

- 0 upon success
- < 0 in case of failure.

18.6 Key and Cert Conversion

18.7 Logging

18.7.1 Functions

Name	
WOLFSSL_API int	<code>wolfSSL_SetLoggingCb</code> (<code>wolfSSL_Logging_cb</code> log_function) This function registers a logging callback

18.7.2 Functions Documentation

18.7.2.1 function `wolfSSL_SetLoggingCb`

```
WOLFSSL_API int wolfSSL_SetLoggingCb(  
    wolfSSL_Logging_cb log_function  
)
```

This function registers a logging callback that will be used to handle the wolfSSL log message. By default, if the system supports it `fprintf()` to `stderr` is used but by using this function anything can be done by the user.

Parameters:

- **log_function** function to register as a logging callback. Function signature must follow the above prototype.

See:

- `wolfSSL_Debugging_ON`
- `wolfSSL_Debugging_OFF`

Return:

- Success If successful this function will return 0.
- `BAD_FUNC_ARG` is the error that will be returned if a function pointer is not provided.

Example

```
int ret = 0;
// Logging callback prototype
void MyLoggingCallback(const int logLevel, const char* const logMessage);
// Register the custom logging callback with wolfSSL
ret = wolfSSL_SetLoggingCb(MyLoggingCallback);
if (ret != 0) {
    // failed to set logging callback
}
void MyLoggingCallback(const int logLevel, const char* const logMessage)
{
    // custom logging function
}
```

WOLFSSL_API word32 CheckRunTimeFastMath(
    void
)
```

This function checks the runtime fastmath settings for the maximum size of an integer. It is important when a user is using a wolfCrypt library independently, as the `FP_SIZE` must match for each library in order for math to work correctly. This check is defined as `CheckFastMathSettings()`, which simply compares `CheckRunTimeFastMath` and `FP_SIZE`, returning 0 if there is a mismatch, or 1 if they match.

Parameters:

- **none** No parameters.

See: [CheckRunTimeSettings](#)

Return: FP_SIZE Returns FP_SIZE, corresponding to the max size available for the math library.

Example

```
if (CheckFastMathSettings() != 1) {
return err_sys("Build vs. runtime fastmath FP_MAX_BITS mismatch\n");
}
// This is converted by the preprocessor to:
// if ( (CheckRunTimeFastMath() == FP_SIZE) != 1) {
// and confirms that the fast math settings match
// the compile time settings
```

18.8.2.2 function CheckRunTimeSettings

```
WOLFSSL_API word32 CheckRunTimeSettings(
    void
)
```

This function checks the compile time class settings. It is important when a user is using a wolfCrypt library independently, as the settings must match between libraries for math to work correctly. This check is defined as CheckCtcSettings(), which simply compares CheckRunTimeSettings and CTC_SETTINGS, returning 0 if there is a mismatch, or 1 if they match.

Parameters:

- **none** No Parameters.

See: [CheckRunTimeFastMath](#)

Return: settings Returns the runtime CTC_SETTINGS (Compile Time Settings)

Example

```
if (CheckCtcSettings() != 1) {
return err_sys("Build vs. runtime math mismatch\n");
}
// This is converted by the preprocessor to:
// if ( (CheckCtcSettings() == CTC_SETTINGS) != 1) {
// and will compare whether the compile time class settings
// match the current settings
```

18.9.2 Functions Documentation

18.9.2.1 function `wc_InitNetRandom`

```
WOLFSSL_API int wc_InitNetRandom(  
    const char * ,  
    wnr_hmac_key ,  
    int  
)
```

Init global Whitewood netRandom context.

Parameters:

- **configFile** Path to configuration file
- **hmac_cb** Optional to create HMAC callback.
- **timeout** A timeout duration.

See: [wc_FreeNetRandom](#)

Return:

- 0 Success
- BAD_FUNC_ARG Either configFile is null or timeout is negative.
- RNG_FAILURE_E There was a failure initializing the rng.

Example

```
char* config = "path/to/config/example.conf";  
int time = // Some sufficient timeout value;  
  
if (wc_InitNetRandom(config, NULL, time) != 0)  
{  
    // Some error occurred  
}
```

18.9.2.2 function `wc_FreeNetRandom`

```
WOLFSSL_API int wc_FreeNetRandom(  
    void  
)
```

Free global Whitewood netRandom context.

Parameters:

- **none** No returns.

See: [wc_InitNetRandom](#)

Return:

- 0 Success
- BAD_MUTEX_E Error locking mutex on wnr_mutex

Example

```
int ret = wc_FreeNetRandom();  
if (ret != 0)  
{  
    // Handle the error  
}
```

18.9.2.3 function wc_InitRng

```
WOLFSSL_API int wc_InitRng(  
    WC_RNG *  
)
```

Gets the seed (from OS) and key cipher for rng. rng->drbg (deterministic random bit generator) allocated (should be deallocated with wc_FreeRng). This is a blocking operation.

Parameters:

- **rng** random number generator to be initialized for use with a seed and key cipher

See:

- wc_InitRngCavium
- [wc_RNG_GenerateBlock](#)
- wc_RNG_GenerateByte
- [wc_FreeRng](#)
- [wc_RNG_HealthTest](#)

Return:

- 0 on success.
- MEMORY_E XMAALLOC failed
- WINCRYPT_E wc_GenerateSeed: failed to acquire context
- CRYPTGEN_E wc_GenerateSeed: failed to get random
- BAD_FUNC_ARG wc_RNG_GenerateBlock input is null or sz exceeds MAX_REQUEST_LEN
- DRBG_CONT_FIPS_E wc_RNG_GenerateBlock: Hash_gen returned DRBG_CONT_FAILURE
- RNG_FAILURE_E wc_RNG_GenerateBlock: Default error. rng's status originally not ok, or set to DRBG_FAILED

Example

```
RNG rng;  
int ret;  
  
#ifdef HAVE_CAVIUM  
ret = wc_InitRngCavium(&rng, CAVIUM_DEV_ID);  
if (ret != 0){  
    printf("RNG Nitrox init for device: %d failed", CAVIUM_DEV_ID);  
    return -1;  
}  
#endif  
ret = wc_InitRng(&rng);  
if (ret != 0){  
    printf("RNG init failed");  
    return -1;  
}
```

18.9.2.4 function wc_RNG_GenerateBlock

```
WOLFSSL_API int wc_RNG_GenerateBlock(  
    WC_RNG * ,  
    byte * ,  
    word32 sz  
)
```

Copies a sz bytes of pseudorandom data to output. Will reseed rng if needed (blocking).

Parameters:

- **rng** random number generator initialized with `wc_InitRng`
- **output** buffer to which the block is copied
- **sz** size of output in bytes

See:

- `wc_InitRngCavium`, `wc_InitRng`
- `wc_RNG_GenerateByte`
- `wc_FreeRng`
- `wc_RNG_HealthTest`

Return:

- 0 on success
- `BAD_FUNC_ARG` an input is null or `sz` exceeds `MAX_REQUEST_LEN`
- `DRBG_CONT_FIPS_E Hash_gen` returned `DRBG_CONT_FAILURE`
- `RNG_FAILURE_E` Default error. `rng`'s status originally not ok, or set to `DRBG_FAILED`

Example

```
RNG rng;
int sz = 32;
byte block[sz];

int ret = wc_InitRng(&rng);
if (ret != 0) {
    return -1; //init of rng failed!
}

ret = wc_RNG_GenerateBlock(&rng, block, sz);
if (ret != 0) {
    return -1; //generating block failed!
}
```

18.9.2.5 function `wc_rng_new`

```
WOLFSSL_API WC_RNG * wc_rng_new(
    byte * nonce,
    word32 nonceSz,
    void * heap
)
```

Creates a new `WC_RNG` structure.

Parameters:

- **heap** pointer to a heap identifier
- **nonce** pointer to the buffer containing the nonce
- **nonceSz** length of the nonce
- **rng** random number generator initialized with `wc_InitRng`
- **b** one byte buffer to which the block is copied

See:

- `wc_InitRng`
- `wc_rng_free`
- `wc_FreeRng`
- `wc_RNG_HealthTest`

- wc_InitRngCavium
- wc_InitRng
- wc_RNG_GenerateBlock
- wc_FreeRng
- wc_RNG_HealthTest

Return:

- WC_RNG structure on success
- NULL on error
- 0 on success
- BAD_FUNC_ARG an input is null or sz exceeds MAX_REQUEST_LEN
- DRBG_CONT_FIPS_E Hash_gen returned DRBG_CONT_FAILURE
- RNG_FAILURE_E Default error. rng's status originally not ok, or set to DRBG_FAILED

Example

```
RNG rng;
byte nonce[] = { initialize nonce };
word32 nonceSz = sizeof(nonce);
```

```
wc_rng_new(&nonce, nonceSz, &heap);
```

Calls wc_RNG_GenerateBlock to copy a byte of pseudorandom data to b. Will reseed rng if needed.

Example

```
RNG rng;
int sz = 32;
byte b[1];

int ret = wc_InitRng(&rng);
if (ret != 0) {
    return -1; //init of rng failed!
}

ret = wc_RNG_GenerateByte(&rng, b);
if (ret != 0) {
    return -1; //generating block failed!
}
```

18.9.2.6 function wc_FreeRng

```
WOLFSSL_API WC_RNG byte *WOLFSSL_API int wc_FreeRng(
    WC_RNG *
)
```

Should be called when RNG no longer needed in order to securely free drgb. Zeros and XFREEs rng-drbg.

Parameters:

- **rng** random number generator initialized with wc_InitRng

See:

- wc_InitRngCavium
- wc_InitRng
- wc_RNG_GenerateBlock
- wc_RNG_GenerateByte,

- `wc_RNG_HealthTest`

Return:

- 0 on success
- BAD_FUNC_ARG rng or rng->drbg null
- RNG_FAILURE_E Failed to deallocated drbg

Example

```
RNG rng;
int ret = wc_InitRng(&rng);
if (ret != 0) {
    return -1; //init of rng failed!
}

int ret = wc_FreeRng(&rng);
if (ret != 0) {
    return -1; //free of rng failed!
}
```

18.9.2.7 function `wc_rng_free`

```
WOLFSSL_API WC_RNG * wc_rng_free(
    WC_RNG * rng
)
```

Should be called when RNG no longer needed in order to securely free rng.

Parameters:

- **rng** random number generator initialized with `wc_InitRng`

See:

- `wc_InitRng`
- `wc_rng_new`
- `wc_FreeRng`
- `wc_RNG_HealthTest`

Example

```
RNG rng;
byte nonce[] = { initialize nonce };
word32 nonceSz = sizeof(nonce);

rng = wc_rng_new(&nonce, nonceSz, &heap);

// use rng

wc_rng_free(&rng);
```

18.9.2.8 function `wc_RNG_HealthTest`

```
WOLFSSL_API int wc_RNG_HealthTest(
    int reseed,
    const byte * entropyA,
    word32 entropyASz,
    const byte * entropyB,
    word32 entropyBSz,
```

```

    byte * output,
    word32 outputSz
)

```

Creates and tests functionality of drbg.

Parameters:

- **int** reseed: if set, will test reseed functionality
- **entropyA** entropy to instantiate drgb with
- **entropyASz** size of entropyA in bytes
- **entropyB** If reseed set, drbg will be reseeded with entropyB
- **entropyBSz** size of entropyB in bytes
- **output** initialized to random data seeded with entropyB if seedrandom is set, and entropyA otherwise
- **outputSz** length of output in bytes

See:

- wc_InitRngCavium
- [wc_InitRng](#)
- [wc_RNG_GenerateBlock](#)
- wc_RNG_GenerateByte
- [wc_FreeRng](#)

Return:

- 0 on success
- BAD_FUNC_ARG entropyA and output must not be null. If reseed set entropyB must not be null
- -1 test failed

Example

```

byte output[SHA256_DIGEST_SIZE * 4];
const byte test1EntropyB[] = ....; // test input for reseed false
const byte test1Output[] = ....; // testvector: expected output of
// reseed false
ret = wc_RNG_HealthTest(0, test1Entropy, sizeof(test1Entropy), NULL, 0,
                        output, sizeof(output));
if (ret != 0)
    return -1; //healthtest without reseed failed

if (XMEMCMP(test1Output, output, sizeof(output)) != 0)
    return -1; //compare to testvector failed: unexpected output

const byte test2EntropyB[] = ....; // test input for reseed
const byte test2Output[] = ....; // testvector expected output of reseed
ret = wc_RNG_HealthTest(1, test2EntropyA, sizeof(test2EntropyA),
                        test2EntropyB, sizeof(test2EntropyB),
                        output, sizeof(output));

if (XMEMCMP(test2Output, output, sizeof(output)) != 0)
    return -1; //compare to testvector failed

```

18.10 Signature API

WOLFSSL_API int	wc_SignatureVerify	(enum wc_HashType hash_type, enum wc_SignatureType sig_type, const byt
WOLFSSL_API int	wc_SignatureGenerate	(enum wc_HashType hash_type, enum wc_SignatureType sig_type, const

18.10.2 Functions Documentation

18.10.2.1 function wc_SignatureGetSize

```
WOLFSSL_API int wc_SignatureGetSize(
    enum wc_SignatureType sig_type,
    const void * key,
    word32 key_len
)
```

This function returns the maximum size of the resulting signature.

Parameters:

- **sig_type** A signature type enum value such as WC_SIGNATURE_TYPE_ECC or WC_SIGNATURE_TYPE_RSA.
- **key** Pointer to a key structure such as ecc_key or RsaKey.
- **key_len** Size of the key structure.

See:

- [wc_HashGetDigestSize](#)
- [wc_SignatureGenerate](#)
- [wc_SignatureVerify](#)

Return: Returns SIG_TYPE_E if sig_type is not supported. Returns BAD_FUNC_ARG if sig_type was invalid. A positive return value indicates the maximum size of a signature.

Example

```
// Get signature length
enum wc_SignatureType sig_type = WC_SIGNATURE_TYPE_ECC;
ecc_key eccKey;
word32 sigLen;
wc_ecc_init(&eccKey);
sigLen = wc_SignatureGetSize(sig_type, &eccKey, sizeof(eccKey));
if (sigLen > 0) {
    // Success
}
```

18.10.2.2 function wc_SignatureVerify

```
WOLFSSL_API int wc_SignatureVerify(
    enum wc_HashType hash_type,
    enum wc_SignatureType sig_type,
    const byte * data,
    word32 data_len,
    const byte * sig,
    word32 sig_len,
    const void * key,
    word32 key_len
)
```

This function validates a signature by hashing the data and using the resulting hash and key to verify the signature.

Parameters:

- **hash_type** A hash type from the “enum wc_HashType” such as “WC_HASH_TYPE_SHA256”.
- **sig_type** A signature type enum value such as WC_SIGNATURE_TYPE_ECC or WC_SIGNATURE_TYPE_RSA.
- **data** Pointer to buffer containing the data to hash.
- **data_len** Length of the data buffer.
- **sig** Pointer to buffer to output signature.
- **sig_len** Length of the signature output buffer.
- **key** Pointer to a key structure such as ecc_key or RsaKey.
- **key_len** Size of the key structure.

See:

- [wc_SignatureGetSize](#)
- [wc_SignatureGenerate](#)

Return:

- 0 Success
- SIG_TYPE_E -231, signature type not enabled/ available
- BAD_FUNC_ARG -173, bad function argument provided
- BUFFER_E -132, output buffer too small or input too large.

Example

```
int ret;
ecc_key eccKey;

// Import the public key
wc_ecc_init(&eccKey);
ret = wc_ecc_import_x963(eccPubKeyBuf, eccPubKeyLen, &eccKey);
// Perform signature verification using public key
ret = wc_SignatureVerify(
    WC_HASH_TYPE_SHA256, WC_SIGNATURE_TYPE_ECC,
    fileBuf, fileLen,
    sigBuf, sigLen,
    &eccKey, sizeof(eccKey));
printf("Signature Verification: %s\n", (ret == 0) ? "Pass" : "Fail", ret);
wc_ecc_free(&eccKey);
```

18.10.2.3 function wc_SignatureGenerate

```
WOLFSSL_API int wc_SignatureGenerate(
    enum wc_HashType hash_type,
    enum wc_SignatureType sig_type,
    const byte * data,
    word32 data_len,
    byte * sig,
    word32 * sig_len,
    const void * key,
    word32 key_len,
    WC_RNG * rng
)
```

This function generates a signature from the data using a key. It first creates a hash of the data then signs the hash using the key.

Parameters:

- **hash_type** A hash type from the “enum wc_HashType” such as “WC_HASH_TYPE_SHA256”.
- **sig_type** A signature type enum value such as WC_SIGNATURE_TYPE_ECC or WC_SIGNATURE_TYPE_RSA.
- **data** Pointer to buffer containing the data to hash.
- **data_len** Length of the data buffer.
- **sig** Pointer to buffer to output signature.
- **sig_len** Length of the signature output buffer.
- **key** Pointer to a key structure such as ecc_key or RsaKey.
- **key_len** Size of the key structure.
- **rng** Pointer to an initialized RNG structure.

See:

- [wc_SignatureGetSize](#)
- [wc_SignatureVerify](#)

Return:

- 0 Success
- SIG_TYPE_E -231, signature type not enabled/ available
- BAD_FUNC_ARG -173, bad function argument provided
- BUFFER_E -132, output buffer too small or input too large.

Example

```
int ret;
WC_RNG rng;
ecc_key eccKey;

wc_InitRng(&rng);
wc_ecc_init(&eccKey);

// Generate key
ret = wc_ecc_make_key(&rng, 32, &eccKey);

// Get signature length and allocate buffer
sigLen = wc_SignatureGetSize(sig_type, &eccKey, sizeof(eccKey));
sigBuf = malloc(sigLen);

// Perform signature verification using public key
ret = wc_SignatureGenerate(
    WC_HASH_TYPE_SHA256, WC_SIGNATURE_TYPE_ECC,
    fileBuf, fileLen,
    sigBuf, &sigLen,
    &eccKey, sizeof(eccKey),
    &rng);
printf("Signature Generation: %s\n", (ret == 0) ? "Pass" : "Fail", ret);

free(sigBuf);
wc_ecc_free(&eccKey);
wc_FreeRng(&rng);
```

18.11 wolfCrypt Init and Cleanup

18.11.1 Functions

	Name
WOLFSSL_API int	wc_HashGetOID (enum wc_HashType hash_type) This function will return the OID for the wc_Has
WOLFSSL_API int	wc_HashGetDigestSize (enum wc_HashType hash_type) This function returns the size of the diges
WOLFSSL_API int	wc_Hash (enum wc_HashType hash_type, const byte * data, word32 data_len, byte * hash, word3
WOLFSSL_API int	wolfCrypt_Init (void) Used to initialize resources used by wolfCrypt.
WOLFSSL_API int	wolfCrypt_Cleanup (void) Used to clean up resources used by wolfCrypt.

18.11.2 Functions Documentation

18.11.2.1 function wc_HashGetOID

```
WOLFSSL_API int wc_HashGetOID(  
    enum wc_HashType hash_type  
)
```

This function will return the OID for the wc_HashType provided.

Parameters:

- **hash_type** A hash type from the “enum wc_HashType” such as “WC_HASH_TYPE_SHA256”.

See:

- [wc_HashGetDigestSize](#)
- [wc_Hash](#)

Return:

- OID returns value greater than 0
- HASH_TYPE_E hash type not supported.
- BAD_FUNC_ARG one of the provided arguments is incorrect.

Example

```
enum wc_HashType hash_type = WC_HASH_TYPE_SHA256;  
int oid = wc_HashGetOID(hash_type);  
if (oid > 0) {  
    // Success  
}
```

18.11.2.2 function wc_HashGetDigestSize

```
WOLFSSL_API int wc_HashGetDigestSize(  
    enum wc_HashType hash_type  
)
```

This function returns the size of the digest (output) for a hash_type. The returns size is used to make sure the output buffer provided to wc_Hash is large enough.

Parameters:

- **hash_type** A hash type from the “enum wc_HashType” such as “WC_HASH_TYPE_SHA256”.

See: [wc_Hash](#)

Return:

- Success A positive return value indicates the digest size for the hash.
- Error Returns HASH_TYPE_E if hash_type is not supported.
- Failure Returns BAD_FUNC_ARG if an invalid hash_type was used.

Example

```
int hash_len = wc_HashGetDigestSize(hash_type);
if (hash_len <= 0) {
    WOLFSSL_MSG("Invalid hash type/len");
    return BAD_FUNC_ARG;
}
```

18.11.2.3 function wc_Hash

```
WOLFSSL_API int wc_Hash(
    enum wc_HashType hash_type,
    const byte * data,
    word32 data_len,
    byte * hash,
    word32 hash_len
)
```

This function performs a hash on the provided data buffer and returns it in the hash buffer provided.

Parameters:

- **hash_type** A hash type from the “enum wc_HashType” such as “WC_HASH_TYPE_SHA256”.
- **data** Pointer to buffer containing the data to hash.
- **data_len** Length of the data buffer.
- **hash** Pointer to buffer used to output the final hash to.
- **hash_len** Length of the hash buffer.

See: [wc_HashGetDigestSize](#)

Return: 0 Success, else error (such as BAD_FUNC_ARG or BUFFER_E).

Example

```
enum wc_HashType hash_type = WC_HASH_TYPE_SHA256;
int hash_len = wc_HashGetDigestSize(hash_type);
if (hash_len > 0) {
    int ret = wc_Hash(hash_type, data, data_len, hash_data, hash_len);
    if (ret == 0) {
        // Success
    }
}
```

18.11.2.4 function wolfCrypt_Init

```
WOLFSSL_API int wolfCrypt_Init(
    void
)
```

Used to initialize resources used by wolfCrypt.

Parameters:

- **none** No parameters.

See: [wolfCrypt_Cleanup](#)

Return:

- 0 upon success.
- <0 upon failure of init resources.

Example

```
...  
if (wolfCrypt_Init() != 0) {  
    WOLFSSL_MSG("Error with wolfCrypt_Init call");  
}
```

18.11.2.5 function wolfCrypt_Cleanup

```
WOLFSSL_API int wolfCrypt_Cleanup(  
    void  
)
```

Used to clean up resources used by wolfCrypt.

Parameters:

- **none** No parameters.

See: [wolfCrypt_Init](#)

Return:

- 0 upon success.
- <0 upon failure of cleaning up resources.

Example

```
...  
if (wolfCrypt_Cleanup() != 0) {  
    WOLFSSL_MSG("Error with wolfCrypt_Cleanup call");  
}
```

18.12.2 Functions Documentation

18.12.2.1 function wc_Des_SetKey

```
WOLFSSL_API int wc_Des_SetKey(  
    Des * des,  
    const byte * key,  
    const byte * iv,  
    int dir  
)
```

This function sets the key and initialization vector (iv) for the Des structure given as argument. It also initializes and allocates space for the buffers needed for encryption and decryption, if these have not yet been initialized. Note: If no iv is provided (i.e. iv == NULL) the initialization vector defaults to an iv of 0.

Parameters:

- **des** pointer to the Des structure to initialize
- **key** pointer to the buffer containing the 8 byte key with which to initialize the Des structure
- **iv** pointer to the buffer containing the 8 byte iv with which to initialize the Des structure. If this is not provided, the iv defaults to 0
- **dir** direction of encryption. Valid options are: DES_ENCRYPTION, and DES_DECRYPTION

See:

- [wc_Des_SetIV](#)
- [wc_Des3_SetKey](#)

Return: 0 On successfully setting the key and initialization vector for the Des structure

3

Example

```
Des enc; // Des structure used for encryption  
int ret;  
byte key[] = { // initialize with 8 byte key };  
byte iv[] = { // initialize with 8 byte iv };  
  
ret = wc_Des_SetKey(&des, key, iv, DES_ENCRYPTION);  
if (ret != 0) {  
    // error initializing des structure  
}
```

18.12.2.2 function wc_Des_SetIV

```
WOLFSSL_API void wc_Des_SetIV(  
    Des * des,  
    const byte * iv  
)
```

This function sets the initialization vector (iv) for the Des structure given as argument. When passed a NULL iv, it sets the initialization vector to 0.

Parameters:

- **des** pointer to the Des structure for which to set the iv
- **iv** pointer to the buffer containing the 8 byte iv with which to initialize the Des structure. If this is not provided, the iv defaults to 0

See: [wc_Des_SetKey](#)

Return: none No returns.

3

Example

```
Des enc; // Des structure used for encryption
// initialize enc with wc_Des_SetKey
byte iv[] = { // initialize with 8 byte iv };
wc_Des_SetIV(&enc, iv);
}
```

18.12.2.3 function `wc_Des_CbcEncrypt`

```
WOLFSSL_API int wc_Des_CbcEncrypt(
    Des * des,
    byte * out,
    const byte * in,
    word32 sz
)
```

This function encrypts the input message, in, and stores the result in the output buffer, out. It uses DES encryption with cipher block chaining (CBC) mode.

Parameters:

- **des** pointer to the Des structure to use for encryption
- **out** pointer to the buffer in which to store the encrypted ciphertext
- **in** pointer to the input buffer containing the message to encrypt
- **sz** length of the message to encrypt

See:

- [wc_Des_SetKey](#)
- [wc_Des_CbcDecrypt](#)

Return: 0 Returned upon successfully encrypting the given input message

3

Example

```
Des enc; // Des structure used for encryption
// initialize enc with wc_Des_SetKey, use mode DES_ENCRYPTION

byte plain[] = { // initialize with message };
byte cipher[sizeof(plain)];

if ( wc_Des_CbcEncrypt(&enc, cipher, plain, sizeof(plain)) != 0 ) {
    // error encrypting message
}
```

18.12.2.4 function `wc_Des_CbcDecrypt`

```
WOLFSSL_API int wc_Des_CbcDecrypt(
    Des * des,
    byte * out,
    const byte * in,
    word32 sz
)
```

)

This function decrypts the input ciphertext, in, and stores the resulting plaintext in the output buffer, out. It uses DES encryption with cipher block chaining (CBC) mode.

Parameters:

- **des** pointer to the Des structure to use for decryption
- **out** pointer to the buffer in which to store the decrypted plaintext
- **in** pointer to the input buffer containing the encrypted ciphertext
- **sz** length of the ciphertext to decrypt

See:

- [wc_Des_SetKey](#)
- [wc_Des_CbcEncrypt](#)

Return: 0 Returned upon successfully decrypting the given ciphertext

3

Example

```
Des dec; // Des structure used for decryption
// initialize dec with wc_Des_SetKey, use mode DES_DECRYPTION

byte cipher[] = { // initialize with ciphertext };
byte decoded[sizeof(cipher)];

if ( wc_Des_CbcDecrypt(&dec, decoded, cipher, sizeof(cipher)) != 0) {
    // error decrypting message
}
```

18.12.2.5 function wc_Des_EcbEncrypt

```
WOLFSSL_API int wc_Des_EcbEncrypt(
    Des * des,
    byte * out,
    const byte * in,
    word32 sz
)
```

This function encrypts the input message, in, and stores the result in the output buffer, out. It uses Des encryption with Electronic Codebook (ECB) mode.

Parameters:

- **des** pointer to the Des structure to use for encryption
- **out** pointer to the buffer in which to store the encrypted message
- **in** pointer to the input buffer containing the plaintext to encrypt
- **sz** length of the plaintext to encrypt

See: [wc_Des_SetKe](#)

Return: 0: Returned upon successfully encrypting the given plaintext.

3

Example

```
Des enc; // Des structure used for encryption
// initialize enc with wc_Des_SetKey, use mode DES_ENCRYPTION
```

```

byte plain[] = { // initialize with message to encrypt };
byte cipher[sizeof(plain)];

if ( wc_Des_EcbEncrypt(&enc,cipher, plain, sizeof(plain)) != 0) {
    // error encrypting message
}

```

18.12.2.6 function wc_Des3_SetKey

```

WOLFSSL_API int wc_Des3_SetKey(
    Des3 * des,
    const byte * key,
    const byte * iv,
    int dir
)

```

This function sets the key and initialization vector (iv) for the Des3 structure given as argument. It also initializes and allocates space for the buffers needed for encryption and decryption, if these have not yet been initialized. Note: If no iv is provided (i.e. iv == NULL) the initialization vector defaults to an iv of 0.

Parameters:

- **des3** pointer to the Des3 structure to initialize
- **key** pointer to the buffer containing the 24 byte key with which to initialize the Des3 structure
- **iv** pointer to the buffer containing the 8 byte iv with which to initialize the Des3 structure. If this is not provided, the iv defaults to 0
- **dir** direction of encryption. Valid options are: DES_ENCRYPTION, and DES_DECRYPTION

See:

- [wc_Des3_SetIV](#)
- [wc_Des3_CbcEncrypt](#)
- [wc_Des3_CbcDecrypt](#)

Return: 0 On successfully setting the key and initialization vector for the Des structure

3

Example

```

Des3 enc; // Des3 structure used for encryption
int ret;
byte key[] = { // initialize with 24 byte key };
byte iv[] = { // initialize with 8 byte iv };

ret = wc_Des3_SetKey(&des, key, iv, DES_ENCRYPTION);
if (ret != 0) {
    // error initializing des structure
}

```

18.12.2.7 function wc_Des3_SetIV

```

WOLFSSL_API int wc_Des3_SetIV(
    Des3 * des,
    const byte * iv
)

```

This function sets the initialization vector (iv) for the Des3 structure given as argument. When passed a NULL iv, it sets the initialization vector to 0.

Parameters:

- **des** pointer to the Des3 structure for which to set the iv
- **iv** pointer to the buffer containing the 8 byte iv with which to initialize the Des3 structure. If this is not provided, the iv defaults to 0

See: [wc_Des3_SetKey](#)

Return: none No returns.

3

Example

```
Des3 enc; // Des3 structure used for encryption
// initialize enc with wc_Des3_SetKey
```

```
byte iv[] = { // initialize with 8 byte iv };
```

```
wc_Des3_SetIV(&enc, iv);
}
```

18.12.2.8 function `wc_Des3_CbcEncrypt`

```
WOLFSSL_API int wc_Des3_CbcEncrypt(
    Des3 * des,
    byte * out,
    const byte * in,
    word32 sz
)
```

This function encrypts the input message, in, and stores the result in the output buffer, out. It uses Triple Des (3DES) encryption with cipher block chaining (CBC) mode.

Parameters:

- **des** pointer to the Des3 structure to use for encryption
- **out** pointer to the buffer in which to store the encrypted ciphertext
- **in** pointer to the input buffer containing the message to encrypt
- **sz** length of the message to encrypt

See:

- [wc_Des3_SetKey](#)
- [wc_Des3_CbcDecrypt](#)

Return: 0 Returned upon successfully encrypting the given input message

3

Example

```
Des3 enc; // Des3 structure used for encryption
// initialize enc with wc_Des3_SetKey, use mode DES_ENCRYPTION
```

```
byte plain[] = { // initialize with message };
byte cipher[sizeof(plain)];
```

```
if ( wc_Des3_CbcEncrypt(&enc, cipher, plain, sizeof(plain)) != 0) {
```

```

    // error encrypting message
}

```

18.12.2.9 function `wc_Des3_CbcDecrypt`

```

WOLFSSL_API int wc_Des3_CbcDecrypt(
    Des3 * des,
    byte * out,
    const byte * in,
    word32 sz
)

```

This function decrypts the input ciphertext, `in`, and stores the resulting plaintext in the output buffer, `out`. It uses Triple Des (3DES) encryption with cipher block chaining (CBC) mode.

Parameters:

- **des** pointer to the Des3 structure to use for decryption
- **out** pointer to the buffer in which to store the decrypted plaintext
- **in** pointer to the input buffer containing the encrypted ciphertext
- **sz** length of the ciphertext to decrypt

See:

- [wc_Des3_SetKey](#)
- [wc_Des3_CbcEncrypt](#)

Return: 0 Returned upon successfully decrypting the given ciphertext

3

Example

```

Des3 dec; // Des structure used for decryption
// initialize dec with wc_Des3_SetKey, use mode DES_DECRYPTION

byte cipher[] = { // initialize with ciphertext };
byte decoded[sizeof(cipher)];

if ( wc_Des3_CbcDecrypt(&dec, decoded, cipher, sizeof(cipher)) != 0 ) {
    // error decrypting message
}

```

18.12.2.10 function `wc_Des_CbcDecryptWithKey`

```

WOLFSSL_API int wc_Des_CbcDecryptWithKey(
    byte * out,
    const byte * in,
    word32 sz,
    const byte * key,
    const byte * iv
)

```

This function decrypts the input ciphertext, `in`, and stores the resulting plaintext in the output buffer, `out`. It uses DES encryption with cipher block chaining (CBC) mode. This function is a substitute for `wc_Des_CbcDecrypt`, allowing the user to decrypt a message without directly instantiating a Des structure.

Parameters:

- **out** pointer to the buffer in which to store the decrypted plaintext
- **in** pointer to the input buffer containing the encrypted ciphertext
- **sz** length of the ciphertext to decrypt
- **key** pointer to the buffer containing the 8 byte key to use for decryption
- **iv** pointer to the buffer containing the 8 byte iv to use for decryption. If no iv is provided, the iv defaults to 0

See: [wc_Des_CbcDecrypt](#)

Return:

- 0 Returned upon successfully decrypting the given ciphertext
- MEMORY_E Returned if there is an error allocating space for a Des structure

3

Example

```
int ret;
byte key[] = { // initialize with 8 byte key };
byte iv[] = { // initialize with 8 byte iv };

byte cipher[] = { // initialize with ciphertext };
byte decoded[sizeof(cipher)];

if ( wc_Des_CbcDecryptWithKey(decoded, cipher, sizeof(cipher), key,
iv) != 0) {
    // error decrypting message
}
```

18.12.2.11 function wc_Des_CbcEncryptWithKey

```
WOLFSSL_API int wc_Des_CbcEncryptWithKey(
    byte * out,
    const byte * in,
    word32 sz,
    const byte * key,
    const byte * iv
)
```

This function encrypts the input plaintext, in, and stores the resulting ciphertext in the output buffer, out. It uses DES encryption with cipher block chaining (CBC) mode. This function is a substitute for wc_Des_CbcEncrypt, allowing the user to encrypt a message without directly instantiating a Des structure.

Parameters:

- **out** Final encrypted data
- **in** Data to be encrypted, must be padded to Des block size.
- **sz** Size of input buffer.
- **key** Pointer to the key to use for encryption.
- **iv** Initialization vector

See:

- [wc_Des_CbcDecryptWithKey](#)
- [wc_Des_CbcEncrypt](#)

Return:

- 0 Returned after successfully encrypting data.

- MEMORY_E Returned if there's an error allocating memory for a Des structure.
- <0 Returned on any error during encryption.

3

Example

```
byte key[] = { // initialize with 8 byte key };
byte iv[] = { // initialize with 8 byte iv };
byte in[] = { // Initialize with plaintext };
byte out[sizeof(in)];
if ( wc_Des_CbcEncryptWithKey(&out, in, sizeof(in), key, iv) != 0)
{
    // error encrypting message
}
```

18.12.2.12 function wc_Des3_CbcEncryptWithKey

```
WOLFSSL_API int wc_Des3_CbcEncryptWithKey(
    byte * out,
    const byte * in,
    word32 sz,
    const byte * key,
    const byte * iv
)
```

This function encrypts the input plaintext, in, and stores the resulting ciphertext in the output buffer, out. It uses Triple DES (3DES) encryption with cipher block chaining (CBC) mode. This function is a substitute for wc_Des3_CbcEncrypt, allowing the user to encrypt a message without directly instantiating a Des3 structure.

Parameters:

- **in** Data to be encrypted, must be padded to Des block size.
- **sz** Size of input buffer.
- **key** Pointer to the key to use for encryption.
- **iv** Initialization vector

See:

- [wc_Des3_CbcDecryptWithKey](#)
- [wc_Des_CbcEncryptWithKey](#)
- [wc_Des_CbcDecryptWithKey](#)

Return:

- 0 Returned after successfully encrypting data.
- MEMORY_E Returned if there's an error allocating memory for a Des structure.
- <0 Returned on any error during encryption.

3

\parma out Final encrypted data *Example*

```
byte key[] = { // initialize with 8 byte key };
byte iv[] = { // initialize with 8 byte iv };

byte in[] = { // Initialize with plaintext };
byte out[sizeof(in)];

if ( wc_Des3_CbcEncryptWithKey(&out, in, sizeof(in), key, iv) != 0)
```

```
{
    // error encrypting message
}
```

18.12.2.13 function wc_Des3_CbcDecryptWithKey

```
WOLFSSL_API int wc_Des3_CbcDecryptWithKey(
    byte * out,
    const byte * in,
    word32 sz,
    const byte * key,
    const byte * iv
)
```

This function decrypts the input ciphertext, in, and stores the resulting plaintext in the output buffer, out. It uses Triple Des (3DES) encryption with cipher block chaining (CBC) mode. This function is a substitute for wc_Des3_CbcDecrypt, allowing the user to decrypt a message without directly instantiating a Des3 structure.

Parameters:

- **out** pointer to the buffer in which to store the decrypted plaintext
- **in** pointer to the input buffer containing the encrypted ciphertext
- **sz** length of the ciphertext to decrypt
- **key** pointer to the buffer containing the 24 byte key to use for decryption
- **iv** pointer to the buffer containing the 8 byte iv to use for decryption. If no iv is provided, the iv defaults to 0

See: [wc_Des3_CbcDecrypt](#)

Return:

- 0 Returned upon successfully decrypting the given ciphertext
- MEMORY_E Returned if there is an error allocating space for a Des structure

3

Example

```
int ret;
byte key[] = { // initialize with 24 byte key };
byte iv[] = { // initialize with 8 byte iv };

byte cipher[] = { // initialize with ciphertext };
byte decoded[sizeof(cipher)];

if ( wc_Des3_CbcDecryptWithKey(decoded, cipher, sizeof(cipher),
key, iv) != 0) {
    // error decrypting message
}
```

18.13 Algorithms - AES

18.13.1 Functions

	Name	
WOLFSSL_API int	wc_AesSetKey (Aes * aes, const byte * key, word32 len, const byte * iv, int dir)	This function initial
WOLFSSL_API int	wc_AesSetIV (Aes * aes, const byte * iv)	This function sets the initialization vector for a particular

	Name
WOLFSSL_API int	wc_AesCbcEncrypt (Aes * aes, byte * out, const byte * in, word32 sz)Encrypts a plaintext message.
WOLFSSL_API int	wc_AesCbcDecrypt (Aes * aes, byte * out, const byte * in, word32 sz)Decrypts a cipher from the ciphertext.
WOLFSSL_API int	wc_AesCtrEncrypt (Aes * aes, byte * out, const byte * in, word32 sz)Encrypts/Decrypts a message using a counter mode.
WOLFSSL_API void	wc_AesEncryptDirect (Aes * aes, byte * out, const byte * in)This function is a one_block encryption function.
WOLFSSL_API void	wc_AesDecryptDirect (Aes * aes, byte * out, const byte * in)This function is a one_block decryption function.
WOLFSSL_API int	wc_AesSetKeyDirect (Aes * aes, const byte * key, word32 len, const byte * iv, int dir)This function sets the key and IV directly.
WOLFSSL_API int	wc_AesGcmSetKey (Aes * aes, const byte * key, word32 len)This function is used to set the key for GCM mode.
WOLFSSL_API int	wc_AesGcmEncrypt (Aes * aes, byte * out, const byte * in, word32 sz, const byte * iv, word32 ivSz)Encrypts a message using GCM mode.
WOLFSSL_API int	wc_AesGcmDecrypt (Aes * aes, byte * out, const byte * in, word32 sz, const byte * iv, word32 ivSz)Decrypts a message using GCM mode.
WOLFSSL_API int	wc_GmacSetKey (Gmac * gmac, const byte * key, word32 len)This function initializes and sets the key for GMAC.
WOLFSSL_API int	wc_GmacUpdate (Gmac * gmac, const byte * iv, word32 ivSz, const byte * authIn, word32 authInSz)Updates the GMAC with a new input.
WOLFSSL_API int	wc_AesCcmSetKey (Aes * aes, const byte * key, word32 keySz)This function sets the key for an AES-CCM structure.
WOLFSSL_API int	wc_AesCcmEncrypt (Aes * aes, byte * out, const byte * in, word32 inSz, const byte * nonce, word32 nonceSz)Encrypts a message using AES-CCM.
WOLFSSL_API int	wc_AesCcmDecrypt (Aes * aes, byte * out, const byte * in, word32 inSz, const byte * nonce, word32 nonceSz)Decrypts a message using AES-CCM.
WOLFSSL_API int	wc_AesXtsSetKey (XtsAes * aes, const byte * key, word32 len, int dir, void * heap, int devId)This function sets the key for XTS mode.
WOLFSSL_API int	wc_AesXtsEncryptSector (XtsAes * aes, byte * out, const byte * in, word32 sz, word64 sector)Encrypts a sector using XTS mode.
WOLFSSL_API int	wc_AesXtsDecryptSector (XtsAes * aes, byte * out, const byte * in, word32 sz, word64 sector)Decrypts a sector using XTS mode.
WOLFSSL_API int	wc_AesXtsEncrypt (XtsAes * aes, byte * out, const byte * in, word32 sz, const byte * i, word32 iSz)Encrypts a message using XTS mode.
WOLFSSL_API int	wc_AesXtsDecrypt (XtsAes * aes, byte * out, const byte * in, word32 sz, const byte * i, word32 iSz)Decrypts a message using XTS mode.
WOLFSSL_API int	wc_AesXtsFree (XtsAes * aes)This is to free up any resources used by the XtsAes structure.
WOLFSSL_API int	wc_AesInit (Aes * , void * , int)Initialize Aes structure. Sets heap hint to be used and ID for use.
WOLFSSL_API int	wc_AesCbcDecryptWithKey (byte * out, const byte * in, word32 inSz, const byte * key, word32 keySz)Decrypts a message using CBC mode with a key.

18.13.2 Functions Documentation

18.13.2.1 function wc_AesSetKey

```
WOLFSSL_API int wc_AesSetKey(
    Aes * aes,
    const byte * key,
    word32 len,
    const byte * iv,
    int dir
)
```

This function initializes an AES structure by setting the key and then setting the initialization vector.

Parameters:

- **aes** pointer to the AES structure to modify
- **key** 16, 24, or 32 byte secret key for encryption and decryption
- **len** length of the key passed in
- **iv** pointer to the initialization vector used to initialize the key
- **dir** Cipher direction. Set AES_ENCRYPTION to encrypt, or AES_DECRYPTION to decrypt.

See:

- [wc_AesSetKeyDirect](#)
- [wc_AesSetIV](#)

Return:

- 0 On successfully setting key and initialization vector.
- BAD_FUNC_ARG Returned if key length is invalid.

Example

```

Aes enc;
int ret = 0;
byte key[] = { some 16, 24 or 32 byte key };
byte iv[] = { some 16 byte iv };
if (ret = wc_AesSetKey(&enc, key, AES_BLOCK_SIZE, iv,
AES_ENCRYPTION) != 0) {
// failed to set aes key
}

```

18.13.2.2 function wc_AesSetIV

```

WOLFSSL_API int wc_AesSetIV(
    Aes * aes,
    const byte * iv
)

```

This function sets the initialization vector for a particular AES object. The AES object should be initialized before calling this function.

Parameters:

- **aes** pointer to the AES structure on which to set the initialization vector
- **iv** initialization vector used to initialize the AES structure. If the value is NULL, the default action initializes the iv to 0.

See:

- [wc_AesSetKeyDirect](#)
- [wc_AesSetKey](#)

Return:

- 0 On successfully setting initialization vector.
- BAD_FUNC_ARG Returned if AES pointer is NULL.

Example

```

Aes enc;
// set enc key
byte iv[] = { some 16 byte iv };
if (ret = wc_AesSetIV(&enc, iv) != 0) {
// failed to set aes iv
}

```

18.13.2.3 function wc_AesCbcEncrypt

```

WOLFSSL_API int wc_AesCbcEncrypt(
    Aes * aes,
    byte * out,
    const byte * in,
    word32 sz
)

```

Encrypts a plaintext message from the input buffer in, and places the resulting cipher text in the output buffer out using cipher block chaining with AES. This function requires that the AES object has been initialized by calling AesSetKey before a message is able to be encrypted. This function assumes that the input message is AES block length aligned, and expects the input length to be a multiple of the block length, which will optionally be checked and enforced if WOLFSSL_AES_CBC_LENGTH_CHECKS is defined in the build configuration. In order to assure block-multiple input, PKCS#7 style padding

should be added beforehand. This differs from the OpenSSL AES-CBC methods which add the padding for you. To make the wolfSSL and corresponding OpenSSL functions interoperate, one should specify the -nopad option in the OpenSSL command line function so that it behaves like the wolfSSL AesCbcEncrypt method and does not add extra padding during encryption.

Parameters:

- **aes** pointer to the AES object used to encrypt data
- **out** pointer to the output buffer in which to store the ciphertext of the encrypted message
- **in** pointer to the input buffer containing message to be encrypted
- **sz** size of input message

See:

- [wc_AesSetKey](#)
- [wc_AesSetIV](#)
- [wc_AesCbcDecrypt](#)

Return:

- 0 On successfully encrypting message.
- BAD_ALIGN_E: may be returned on block align error
- BAD_LENGTH_E will be returned if the input length isn't a multiple of the AES block length, when the library is built with WOLFSSL_AES_CBC_LENGTH_CHECKS.

Example

```
Aes enc;
int ret = 0;
// initialize enc with AesSetKey, using direction AES_ENCRYPTION
byte msg[AES_BLOCK_SIZE * n]; // multiple of 16 bytes
// fill msg with data
byte cipher[AES_BLOCK_SIZE * n]; // Some multiple of 16 bytes
if ((ret = wc_AesCbcEncrypt(&enc, cipher, message, sizeof(msg))) != 0 ) {
// block align error
}
```

18.13.2.4 function wc_AesCbcDecrypt

```
WOLFSSL_API int wc_AesCbcDecrypt(
    Aes * aes,
    byte * out,
    const byte * in,
    word32 sz
)
```

Decrypts a cipher from the input buffer in, and places the resulting plain text in the output buffer out using cipher block chaining with AES. This function requires that the AES structure has been initialized by calling AesSetKey before a message is able to be decrypted. This function assumes that the original message was AES block length aligned, and expects the input length to be a multiple of the block length, which will optionally be checked and enforced if WOLFSSL_AES_CBC_LENGTH_CHECKS is defined in the build configuration. This differs from the OpenSSL AES-CBC methods, which add PKCS#7 padding automatically, and so do not require block-multiple input. To make the wolfSSL function and equivalent OpenSSL functions interoperate, one should specify the -nopad option in the OpenSSL command line function so that it behaves like the wolfSSL AesCbcEncrypt method and does not create errors during decryption.

Parameters:

- **aes** pointer to the AES object used to decrypt data.

- **out** pointer to the output buffer in which to store the plain text of the decrypted message.
- **in** pointer to the input buffer containing cipher text to be decrypted.
- **sz** size of input message.

See:

- [wc_AesSetKey](#)
- [wc_AesCbcEncrypt](#)

Return:

- 0 On successfully decrypting message.
- BAD_ALIGN_E may be returned on block align error.
- BAD_LENGTH_E will be returned if the input length isn't a multiple of the AES block length, when the library is built with WOLFSSL_AES_CBC_LENGTH_CHECKS.

Example

```
Aes dec;
int ret = 0;
// initialize dec with AesSetKey, using direction AES_DECRYPTION
byte cipher[AES_BLOCK_SIZE * n]; // some multiple of 16 bytes
// fill cipher with cipher text
byte plain [AES_BLOCK_SIZE * n];
if ((ret = wc_AesCbcDecrypt(&dec, plain, cipher, sizeof(cipher))) != 0 ) {
// block align error
}
```

18.13.2.5 function wc_AesCtrEncrypt

```
WOLFSSL_API int wc_AesCtrEncrypt(
    Aes * aes,
    byte * out,
    const byte * in,
    word32 sz
)
```

Encrypts/Decrypts a message from the input buffer in, and places the resulting cipher text in the output buffer out using CTR mode with AES. This function is only enabled if WOLFSSL_AES_COUNTER is enabled at compile time. The AES structure should be initialized through AesSetKey before calling this function. Note that this function is used for both decryption and encryption. *NOTE:* Regarding using same API for encryption and decryption. User should differentiate between Aes structures for encrypt/decrypt.

Parameters:

- **aes** pointer to the AES object used to decrypt data
- **out** pointer to the output buffer in which to store the cipher text of the encrypted message
- **in** pointer to the input buffer containing plain text to be encrypted
- **sz** size of the input plain text

See: [wc_AesSetKey](#)

Return: int integer values corresponding to wolfSSL error or success status

Example

```
Aes enc;
Aes dec;
// initialize enc and dec with AesSetKeyDirect, using direction
AES_ENCRYPTION
```

```
// since the underlying API only calls Encrypt and by default calling
encrypt on
// a cipher results in a decryption of the cipher

byte msg[AES_BLOCK_SIZE * n]; //n being a positive integer making msg
some multiple of 16 bytes
// fill plain with message text
byte cipher[AES_BLOCK_SIZE * n];
byte decrypted[AES_BLOCK_SIZE * n];
wc_AesCtrEncrypt(&enc, cipher, msg, sizeof(msg)); // encrypt plain
wc_AesCtrEncrypt(&dec, decrypted, cipher, sizeof(cipher));
// decrypt cipher text
```

18.13.2.6 function wc_AesEncryptDirect

```
WOLFSSL_API void wc_AesEncryptDirect(
    Aes * aes,
    byte * out,
    const byte * in
)
```

This function is a one-block encrypt of the input block, in, into the output block, out. It uses the key and iv (initialization vector) of the provided AES structure, which should be initialized with wc_AesSetKey before calling this function. It is only enabled if the configure option WOLFSSL_AES_DIRECT is enabled.

Warning: In nearly all use cases ECB mode is considered to be less secure. Please avoid using ECB API's directly whenever possible.

Parameters:

- **aes** pointer to the AES object used to encrypt data
- **out** pointer to the output buffer in which to store the cipher text of the encrypted message
- **in** pointer to the input buffer containing plain text to be encrypted

See:

- [wc_AesDecryptDirect](#)
- [wc_AesSetKeyDirect](#)

Example

```
Aes enc;
// initialize enc with AesSetKey, using direction AES_ENCRYPTION
byte msg [AES_BLOCK_SIZE]; // 16 bytes
// initialize msg with plain text to encrypt
byte cipher[AES_BLOCK_SIZE];
wc_AesEncryptDirect(&enc, cipher, msg);
```

18.13.2.7 function wc_AesDecryptDirect

```
WOLFSSL_API void wc_AesDecryptDirect(
    Aes * aes,
    byte * out,
    const byte * in
)
```

This function is a one-block decrypt of the input block, in, into the output block, out. It uses the key and iv (initialization vector) of the provided AES structure, which should be initialized with wc_AesSetKey before calling this function. It is only enabled if the configure option WOLFSSL_AES_DIRECT is enabled,

and there is support for direct AES encryption on the system in question. **Warning:** In nearly all use cases ECB mode is considered to be less secure. Please avoid using ECB API's directly whenever possible.

Parameters:

- **aes** pointer to the AES object used to encrypt data
- **out** pointer to the output buffer in which to store the plain text of the decrypted cipher text
- **in** pointer to the input buffer containing cipher text to be decrypted

See:

- [wc_AesEncryptDirect](#)
- [wc_AesSetKeyDirect](#)

Return: none

Example

```
Aes dec;
// initialize enc with AesSetKey, using direction AES_DECRYPTION
byte cipher [AES_BLOCK_SIZE]; // 16 bytes
// initialize cipher with cipher text to decrypt
byte msg[AES_BLOCK_SIZE];
wc_AesDecryptDirect(&dec, msg, cipher);
```

18.13.2.8 function wc_AesSetKeyDirect

```
WOLFSSL_API int wc_AesSetKeyDirect(
    Aes * aes,
    const byte * key,
    word32 len,
    const byte * iv,
    int dir
)
```

This function is used to set the AES keys for CTR mode with AES. It initializes an AES object with the given key, iv (initialization vector), and encryption dir (direction). It is only enabled if the configure option WOLFSSL_AES_DIRECT is enabled. Currently wc_AesSetKeyDirect uses wc_AesSetKey internally. **Warning:** In nearly all use cases ECB mode is considered to be less secure. Please avoid using ECB API's directly whenever possible.

Parameters:

- **aes** pointer to the AES object used to encrypt data
- **key** 16, 24, or 32 byte secret key for encryption and decryption
- **len** length of the key passed in
- **iv** initialization vector used to initialize the key
- **dir** Cipher direction. Set AES_ENCRYPTION to encrypt, or AES_DECRYPTION to decrypt. (See enum in wolfssl/wolfcrypt/aes.h) (NOTE: If using wc_AesSetKeyDirect with Aes Counter mode (Stream cipher) only use AES_ENCRYPTION for both encrypting and decrypting)

See:

- [wc_AesEncryptDirect](#)
- [wc_AesDecryptDirect](#)
- [wc_AesSetKey](#)

Return:

- 0 On successfully setting the key.

- BAD_FUNC_ARG Returned if the given key is an invalid length.

Example

```
Aes enc;
int ret = 0;
byte key[] = { some 16, 24, or 32 byte key };
byte iv[] = { some 16 byte iv };
if (ret = wc_AesSetKeyDirect(&enc, key, sizeof(key), iv,
AES_ENCRYPTION) != 0) {
// failed to set aes key
}
```

18.13.2.9 function wc_AesGcmSetKey

```
WOLFSSL_API int wc_AesGcmSetKey(
    Aes * aes,
    const byte * key,
    word32 len
)
```

This function is used to set the key for AES GCM (Galois/Counter Mode). It initializes an AES object with the given key. It is only enabled if the configure option HAVE_AESGCM is enabled at compile time.

Parameters:

- **aes** pointer to the AES object used to encrypt data
- **key** 16, 24, or 32 byte secret key for encryption and decryption
- **len** length of the key passed in

See:

- [wc_AesGcmEncrypt](#)
- [wc_AesGcmDecrypt](#)

Return:

- 0 On successfully setting the key.
- BAD_FUNC_ARG Returned if the given key is an invalid length.

Example

```
Aes enc;
int ret = 0;
byte key[] = { some 16, 24, 32 byte key };
if (ret = wc_AesGcmSetKey(&enc, key, sizeof(key)) != 0) {
// failed to set aes key
}
```

18.13.2.10 function wc_AesGcmEncrypt

```
WOLFSSL_API int wc_AesGcmEncrypt(
    Aes * aes,
    byte * out,
    const byte * in,
    word32 sz,
    const byte * iv,
    word32 ivSz,
    byte * authTag,
    word32 authTagSz,
```

```

    const byte * authIn,
    word32 authInSz
)

```

This function encrypts the input message, held in the buffer `in`, and stores the resulting cipher text in the output buffer `out`. It requires a new iv (initialization vector) for each call to encrypt. It also encodes the input authentication vector, `authIn`, into the authentication tag, `authTag`.

Parameters:

- **aes** - pointer to the AES object used to encrypt data
- **out** pointer to the output buffer in which to store the cipher text
- **in** pointer to the input buffer holding the message to encrypt
- **sz** length of the input message to encrypt
- **iv** pointer to the buffer containing the initialization vector
- **ivSz** length of the initialization vector
- **authTag** pointer to the buffer in which to store the authentication tag
- **authTagSz** length of the desired authentication tag
- **authIn** pointer to the buffer containing the input authentication vector
- **authInSz** length of the input authentication vector

See:

- [wc_AesGcmSetKey](#)
- [wc_AesGcmDecrypt](#)

Return: 0 On successfully encrypting the input message

Example

```

Aes enc;
// initialize aes structure by calling wc_AesGcmSetKey

byte plain[AES_BLOCK_LENGTH * n]; //n being a positive integer
making plain some multiple of 16 bytes
// initialize plain with msg to encrypt
byte cipher[sizeof(plain)];
byte iv[] = // some 16 byte iv
byte authTag[AUTH_TAG_LENGTH];
byte authIn[] = // Authentication Vector

wc_AesGcmEncrypt(&enc, cipher, plain, sizeof(cipher), iv, sizeof(iv),
    authTag, sizeof(authTag), authIn, sizeof(authIn));

```

18.13.2.11 function wc_AesGcmDecrypt

```

WOLFSSL_API int wc_AesGcmDecrypt(
    Aes * aes,
    byte * out,
    const byte * in,
    word32 sz,
    const byte * iv,
    word32 ivSz,
    const byte * authTag,
    word32 authTagSz,
    const byte * authIn,
    word32 authInSz
)

```

This function decrypts the input cipher text, held in the buffer `in`, and stores the resulting message text in the output buffer `out`. It also checks the input authentication vector, `authIn`, against the supplied authentication tag, `authTag`.

Parameters:

- **aes** pointer to the AES object used to encrypt data
- **out** pointer to the output buffer in which to store the message text
- **in** pointer to the input buffer holding the cipher text to decrypt
- **sz** length of the cipher text to decrypt
- **iv** pointer to the buffer containing the initialization vector
- **ivSz** length of the initialization vector
- **authTag** pointer to the buffer containing the authentication tag
- **authTagSz** length of the desired authentication tag
- **authIn** pointer to the buffer containing the input authentication vector
- **authInSz** length of the input authentication vector

See:

- [wc_AesGcmSetKey](#)
- [wc_AesGcmEncrypt](#)

Return:

- 0 On successfully decrypting the input message
- AES_GCM_AUTH_E If the authentication tag does not match the supplied authentication code vector, `authTag`.

Example

```
Aes enc; //can use the same struct as was passed to wc_AesGcmEncrypt
// initialize aes structure by calling wc_AesGcmSetKey if not already done

byte cipher[AES_BLOCK_LENGTH * n]; //n being a positive integer
making cipher some multiple of 16 bytes
// initialize cipher with cipher text to decrypt
byte output[sizeof(cipher)];
byte iv[] = // some 16 byte iv
byte authTag[AUTH_TAG_LENGTH];
byte authIn[] = // Authentication Vector

wc_AesGcmDecrypt(&enc, output, cipher, sizeof(cipher), iv, sizeof(iv),
                authTag, sizeof(authTag), authIn, sizeof(authIn));
```

18.13.2.12 function `wc_GmacSetKey`

```
WOLFSSL_API int wc_GmacSetKey(
    Gmac * gmac,
    const byte * key,
    word32 len
)
```

This function initializes and sets the key for a GMAC object to be used for Galois Message Authentication.

Parameters:

- **gmac** pointer to the gmac object used for authentication
- **key** 16, 24, or 32 byte secret key for authentication
- **len** length of the key

See: [wc_GmacUpdate](#)

Return:

- 0 On successfully setting the key
- BAD_FUNC_ARG Returned if key length is invalid.

Example

```
Gmac gmac;  
key[] = { some 16, 24, or 32 byte length key };  
wc_GmacSetKey(&gmac, key, sizeof(key));
```

18.13.2.13 function wc_GmacUpdate

```
WOLFSSL_API int wc_GmacUpdate(  
    Gmac * gmac,  
    const byte * iv,  
    word32 ivSz,  
    const byte * authIn,  
    word32 authInSz,  
    byte * authTag,  
    word32 authTagSz  
)
```

This function generates the Gmac hash of the authIn input and stores the result in the authTag buffer. After running wc_GmacUpdate, one should compare the generated authTag to a known authentication tag to verify the authenticity of a message.

Parameters:

- **gmac** pointer to the gmac object used for authentication
- **iv** initialization vector used for the hash
- **ivSz** size of the initialization vector used
- **authIn** pointer to the buffer containing the authentication vector to verify
- **authInSz** size of the authentication vector
- **authTag** pointer to the output buffer in which to store the Gmac hash
- **authTagSz** the size of the output buffer used to store the Gmac hash

See: [wc_GmacSetKey](#)

Return: 0 On successfully computing the Gmac hash.

Example

```
Gmac gmac;  
key[] = { some 16, 24, or 32 byte length key };  
iv[] = { some 16 byte length iv };  
  
wc_GmacSetKey(&gmac, key, sizeof(key));  
authIn[] = { some 16 byte authentication input };  
tag[AES_BLOCK_SIZE]; // will store authentication code  
  
wc_GmacUpdate(&gmac, iv, sizeof(iv), authIn, sizeof(authIn), tag,  
sizeof(tag));
```

18.13.2.14 function wc_AesCcmSetKey

```
WOLFSSL_API int wc_AesCcmSetKey(  
    Aes * aes,
```

```

    const byte * key,
    word32 keySz
)

```

This function sets the key for an AES object using CCM (Counter with CBC-MAC). It takes a pointer to an AES structure and initializes it with supplied key.

Parameters:

- **aes** aes structure in which to store the supplied key
- **key** 16, 24, or 32 byte secret key for encryption and decryption
- **keySz** size of the supplied key

See:

- [wc_AesCcmEncrypt](#)
- [wc_AesCcmDecrypt](#)

Return: none

Example

```

Aes enc;
key[] = { some 16, 24, or 32 byte length key };

wc_AesCcmSetKey(&aes, key, sizeof(key));

```

18.13.2.15 function **wc_AesCcmEncrypt**

```

WOLFSSL_API int wc_AesCcmEncrypt(
    Aes * aes,
    byte * out,
    const byte * in,
    word32 inSz,
    const byte * nonce,
    word32 nonceSz,
    byte * authTag,
    word32 authTagSz,
    const byte * authIn,
    word32 authInSz
)

```

This function encrypts the input message, in, into the output buffer, out, using CCM (Counter with CBC-MAC). It subsequently calculates and stores the authorization tag, authTag, from the authIn input.

Parameters:

- **aes** pointer to the AES object used to encrypt data
- **out** pointer to the output buffer in which to store the cipher text
- **in** pointer to the input buffer holding the message to encrypt
- **sz** length of the input message to encrypt
- **nonce** pointer to the buffer containing the nonce (number only used once)
- **nonceSz** length of the nonce
- **authTag** pointer to the buffer in which to store the authentication tag
- **authTagSz** length of the desired authentication tag
- **authIn** pointer to the buffer containing the input authentication vector
- **authInSz** length of the input authentication vector

See:

- [wc_AesCcmSetKey](#)

- [wc_AesCcmDecrypt](#)

Return: none

Example

```
Aes enc;
// initialize enc with wc_AesCcmSetKey

nonce[] = { initialize nonce };
plain[] = { some plain text message };
cipher[sizeof(plain)];

authIn[] = { some 16 byte authentication input };
tag[AES_BLOCK_SIZE]; // will store authentication code

wc_AesCcmEncrypt(&enc, cipher, plain, sizeof(plain), nonce, sizeof(nonce),
    tag, sizeof(tag), authIn, sizeof(authIn));
```

18.13.2.16 function `wc_AesCcmDecrypt`

```
WOLFSSL_API int wc_AesCcmDecrypt(
    Aes * aes,
    byte * out,
    const byte * in,
    word32 inSz,
    const byte * nonce,
    word32 nonceSz,
    const byte * authTag,
    word32 authTagSz,
    const byte * authIn,
    word32 authInSz
)
```

This function decrypts the input cipher text, `in`, into the output buffer, `out`, using CCM (Counter with CBC-MAC). It subsequently calculates the authorization tag, `authTag`, from the `authIn` input. If the authorization tag is invalid, it sets the output buffer to zero and returns the error: `AES_CCM_AUTH_E`.

Parameters:

- **aes** pointer to the AES object used to encrypt data
- **out** pointer to the output buffer in which to store the cipher text
- **in** pointer to the input buffer holding the message to encrypt
- **sz** length of the input cipher text to decrypt
- **nonce** pointer to the buffer containing the nonce (number only used once)
- **nonceSz** length of the nonce
- **authTag** pointer to the buffer in which to store the authentication tag
- **authTagSz** length of the desired authentication tag
- **authIn** pointer to the buffer containing the input authentication vector
- **authInSz** length of the input authentication vector

See:

- [wc_AesCcmSetKey](#)
- [wc_AesCcmEncrypt](#)

Return:

- 0 On successfully decrypting the input message

- AES_CCM_AUTH_E If the authentication tag does not match the supplied authentication code vector, authTag.

Example

```
Aes dec;
// initialize dec with wc_AesCcmSetKey

nonce[] = { initialize nonce };
cipher[] = { encrypted message };
plain[sizeof(cipher)];

authIn[] = { some 16 byte authentication input };
tag[AES_BLOCK_SIZE] = { authentication tag received for verification };

int return = wc_AesCcmDecrypt(&dec, plain, cipher, sizeof(cipher),
nonce, sizeof(nonce), tag, sizeof(tag), authIn, sizeof(authIn));
if(return != 0) {
// decrypt error, invalid authentication code
}
```

18.13.2.17 function wc_AesXtsSetKey

```
WOLFSSL_API int wc_AesXtsSetKey(
    XtsAes * aes,
    const byte * key,
    word32 len,
    int dir,
    void * heap,
    int devId
)
```

This is to help with setting keys to correct encrypt or decrypt type. It is up to user to call wc_AesXtsFree on aes key when done.

Parameters:

- **aes** AES keys for encrypt/decrypt process
- **key** buffer holding aes key | tweak key
- **len** length of key buffer in bytes. Should be twice that of key size. i.e. 32 for a 16 byte key.
- **dir** direction, either AES_ENCRYPTION or AES_DECRYPTION
- **heap** heap hint to use for memory. Can be NULL
- **devId** id to use with async crypto. Can be 0

See:

- [wc_AesXtsEncrypt](#)
- [wc_AesXtsDecrypt](#)
- [wc_AesXtsFree](#)

Return: 0 Success

Example

```
XtsAes aes;

if(wc_AesXtsSetKey(&aes, key, sizeof(key), AES_ENCRYPTION, NULL, 0) != 0)
{
// Handle error
}
```

```

}
wc_AesXtsFree(&aes);

```

18.13.2.18 function wc_AesXtsEncryptSector

```

WOLFSSL_API int wc_AesXtsEncryptSector(
    XtsAes * aes,
    byte * out,
    const byte * in,
    word32 sz,
    word64 sector
)

```

Same process as wc_AesXtsEncrypt but uses a word64 type as the tweak value instead of a byte array. This just converts the word64 to a byte array and calls wc_AesXtsEncrypt.

Parameters:

- **aes** AES keys to use for block encrypt/decrypt
- **out** output buffer to hold cipher text
- **in** input plain text buffer to encrypt
- **sz** size of both out and in buffers
- **sector** value to use for tweak

See:

- [wc_AesXtsEncrypt](#)
- [wc_AesXtsDecrypt](#)
- [wc_AesXtsSetKey](#)
- [wc_AesXtsFree](#)

Return: 0 Success

Example

```

XtsAes aes;
unsigned char plain[SIZE];
unsigned char cipher[SIZE];
word64 s = VALUE;

//set up keys with AES_ENCRYPTION as dir

if(wc_AesXtsEncryptSector(&aes, cipher, plain, SIZE, s) != 0)
{
    // Handle error
}
wc_AesXtsFree(&aes);

```

18.13.2.19 function wc_AesXtsDecryptSector

```

WOLFSSL_API int wc_AesXtsDecryptSector(
    XtsAes * aes,
    byte * out,
    const byte * in,
    word32 sz,
    word64 sector
)

```

Same process as `wc_AesXtsDecrypt` but uses a `word64` type as the tweak value instead of a byte array. This just converts the `word64` to a byte array.

Parameters:

- **aes** AES keys to use for block encrypt/decrypt
- **out** output buffer to hold plain text
- **in** input cipher text buffer to decrypt
- **sz** size of both out and in buffers
- **sector** value to use for tweak

See:

- `wc_AesXtsEncrypt`
- `wc_AesXtsDecrypt`
- `wc_AesXtsSetKey`
- `wc_AesXtsFree`

Return: 0 Success

Example

```
XtsAes aes;
unsigned char plain[SIZE];
unsigned char cipher[SIZE];
word64 s = VALUE;
```

```
//set up aes key with AES_DECRYPTION as dir and tweak with AES_ENCRYPTION
```

```
if(wc_AesXtsDecryptSector(&aes, plain, cipher, SIZE, s) != 0)
{
    // Handle error
}
wc_AesXtsFree(&aes);
```

18.13.2.20 function `wc_AesXtsEncrypt`

```
WOLFSSL_API int wc_AesXtsEncrypt(
    XtsAes * aes,
    byte * out,
    const byte * in,
    word32 sz,
    const byte * i,
    word32 iSz
)
```

AES with XTS mode. (XTS) XEX encryption with Tweak and cipher text Stealing.

Parameters:

- **aes** AES keys to use for block encrypt/decrypt
- **out** output buffer to hold cipher text
- **in** input plain text buffer to encrypt
- **sz** size of both out and in buffers
- **i** value to use for tweak
- **iSz** size of i buffer, should always be `AES_BLOCK_SIZE` but having this input adds a sanity check on how the user calls the function.

See:

- `wc_AesXtsDecrypt`
- `wc_AesXtsSetKey`
- `wc_AesXtsFree`

Return: 0 Success

Example

```
XtsAes aes;
unsigned char plain[SIZE];
unsigned char cipher[SIZE];
unsigned char i[AES_BLOCK_SIZE];

//set up key with AES_ENCRYPTION as dir

if(wc_AesXtsEncrypt(&aes, cipher, plain, SIZE, i, sizeof(i)) != 0)
{
    // Handle error
}
wc_AesXtsFree(&aes);
```

18.13.2.21 function `wc_AesXtsDecrypt`

```
WOLFSSL_API int wc_AesXtsDecrypt(
    XtsAes * aes,
    byte * out,
    const byte * in,
    word32 sz,
    const byte * i,
    word32 iSz
)
```

Same process as encryption but Aes key is AES_DECRYPTION type.

Parameters:

- **aes** AES keys to use for block encrypt/decrypt
- **out** output buffer to hold plain text
- **in** input cipher text buffer to decrypt
- **sz** size of both out and in buffers
- **i** value to use for tweak
- **iSz** size of i buffer, should always be AES_BLOCK_SIZE but having this input adds a sanity check on how the user calls the function.

See:

- `wc_AesXtsEncrypt`
- `wc_AesXtsSetKey`
- `wc_AesXtsFree`

Return: 0 Success

Example

```
XtsAes aes;
unsigned char plain[SIZE];
unsigned char cipher[SIZE];
unsigned char i[AES_BLOCK_SIZE];

//set up key with AES_DECRYPTION as dir and tweak with AES_ENCRYPTION
```

```

if(wc_AesXtsDecrypt(&aes, plain, cipher, SIZE, i, sizeof(i)) != 0)
{
    // Handle error
}
wc_AesXtsFree(&aes);

```

18.13.2.22 function wc_AesXtsFree

```

WOLFSSL_API int wc_AesXtsFree(
    XtsAes * aes
)

```

This is to free up any resources used by the XtsAes structure.

Parameters:

- **aes** AES keys to free

See:

- [wc_AesXtsEncrypt](#)
- [wc_AesXtsDecrypt](#)
- [wc_AesXtsSetKey](#)

Return: 0 Success

Example

```

XtsAes aes;

```

```

if(wc_AesXtsSetKey(&aes, key, sizeof(key), AES_ENCRYPTION, NULL, 0) != 0)
{
    // Handle error
}
wc_AesXtsFree(&aes);

```

18.13.2.23 function wc_AesInit

```

WOLFSSL_API int wc_AesInit(
    Aes * ,
    void * ,
    int
)

```

Initialize Aes structure. Sets heap hint to be used and ID for use with async hardware.

Parameters:

- **aes** aes structure in to initialize
- **heap** heap hint to use for malloc / free if needed
- **devId** ID to use with async hardware

See:

- [wc_AesSetKey](#)
- [wc_AesSetIV](#)

Return: 0 Success

Example

```

Aes enc;
void* hint = NULL;
int devId = INVALID_DEVID; //if not using async INVALID_DEVID is default

//heap hint could be set here if used

wc_AesInit(&aes, hint, devId);

```

18.13.2.24 function wc_AesCbcDecryptWithKey

```

WOLFSSL_API int wc_AesCbcDecryptWithKey(
    byte * out,
    const byte * in,
    word32 inSz,
    const byte * key,
    word32 keySz,
    const byte * iv
)

```

Decrypts a cipher from the input buffer in, and places the resulting plain text in the output buffer out using cipher block chaining with AES. This function does not require an AES structure to be initialized. Instead, it takes in a key and an iv (initialization vector) and uses these to initialize an AES object and then decrypt the cipher text.

Parameters:

- **out** pointer to the output buffer in which to store the plain text of the decrypted message
- **in** pointer to the input buffer containing cipher text to be decrypted
- **inSz** size of input message
- **key** 16, 24, or 32 byte secret key for decryption
- **keySz** size of key used for decryption

See:

- [wc_AesSetKey](#)
- [wc_AesSetIV](#)
- [wc_AesCbcEncrypt](#)
- [wc_AesCbcDecrypt](#)

Return:

- 0 On successfully decrypting message
- BAD_ALIGN_E Returned on block align error
- BAD_FUNC_ARG Returned if key length is invalid or AES object is null during AesSetIV
- MEMORY_E Returned if WOLFSSL_SMALL_STACK is enabled and XMALLOC fails to instantiate an AES object.

Example

```

int ret = 0;
byte key[] = { some 16, 24, or 32 byte key };
byte iv[] = { some 16 byte iv };
byte cipher[AES_BLOCK_SIZE * n]; //n being a positive integer making
cipher some multiple of 16 bytes
// fill cipher with cipher text
byte plain [AES_BLOCK_SIZE * n];
if ((ret = wc_AesCbcDecryptWithKey(plain, cipher, AES_BLOCK_SIZE, key,
AES_BLOCK_SIZE, iv)) != 0 ) {

```

```
// Decrypt Error
}
```

18.14 Algorithms - ARC4

18.14.1 Functions

	Name	
WOLFSSL_API int	wc_Arc4Process (Arc4 *, byte *, const byte *, word32)	This function encrypts an input message
WOLFSSL_API int	wc_Arc4SetKey (Arc4 *, const byte *, word32)	This function sets the key for a ARC4 object, initial

18.14.2 Functions Documentation

18.14.2.1 function wc_Arc4Process

```
WOLFSSL_API int wc_Arc4Process(
    Arc4 * ,
    byte * ,
    const byte * ,
    word32
)
```

This function encrypts an input message from the buffer in, placing the ciphertext in the output buffer out, or decrypts a ciphertext from the buffer in, placing the plaintext in the output buffer out, using ARC4 encryption. This function is used for both encryption and decryption. Before this method may be called, one must first initialize the ARC4 structure using wc_Arc4SetKey.

Parameters:

- **arc4** pointer to the ARC4 structure used to process the message
- **out** pointer to the output buffer in which to store the processed message
- **in** pointer to the input buffer containing the message to process
- **length** length of the message to process

See: [wc_Arc4SetKey](#)

Return: none

Example

```
Arc4 enc;
byte key[] = { key to use for encryption };
wc_Arc4SetKey(&enc, key, sizeof(key));

byte plain[] = { plain text to encode };
byte cipher[sizeof(plain)];
byte decrypted[sizeof(plain)];
// encrypt the plain into cipher
wc_Arc4Process(&enc, cipher, plain, sizeof(plain));
// decrypt the cipher
wc_Arc4Process(&enc, decrypted, cipher, sizeof(cipher));
```

18.14.2.2 function wc_Arc4SetKey

```
WOLFSSL_API int wc_Arc4SetKey(
    Arc4 * ,
    const byte * ,
```

```

    word32
)

```

This function sets the key for a ARC4 object, initializing it for use as a cipher. It should be called before using it for encryption with `wc_Arc4Process`.

Parameters:

- **arc4** pointer to an arc4 structure to be used for encryption
- **key** key with which to initialize the arc4 structure
- **length** length of the key used to initialize the arc4 structure

See: [wc_Arc4Process](#)

Return: none

Example

```

Arc4 enc;
byte key[] = { initialize with key to use for encryption };
wc_Arc4SetKey(&enc, key, sizeof(key));

```

WOLFSSL_API int	wc_Blake2bFinal (Blake2b *, byte *, word32)	This function computes the Blake2b hash of the pr

18.15.2 Functions Documentation

18.15.2.1 function wc_InitBlake2b

```

WOLFSSL_API int wc_InitBlake2b(
    Blake2b * ,
    word32
)

```

This function initializes a Blake2b structure for use with the Blake2 hash function.

Parameters:

- **b2b** pointer to the Blake2b structure to initialize
- **digestSz** length of the blake 2 digest to implement

See: [wc_Blake2bUpdate](#)

Return: 0 Returned upon successfully initializing the Blake2b structure and setting the digest size.

Example

```

Blake2b b2b;
// initialize Blake2b structure with 64 byte digest
wc_InitBlake2b(&b2b, 64);

```

18.15.2.2 function wc_Blake2bUpdate

```
WOLFSSL_API int wc_Blake2bUpdate(
    Blake2b * ,
    const byte * ,
    word32
)
```

This function updates the Blake2b hash with the given input data. This function should be called after `wc_InitBlake2b`, and repeated until one is ready for the final hash: `wc_Blake2bFinal`.

Parameters:

- **b2b** pointer to the Blake2b structure to update
- **data** pointer to a buffer containing the data to append
- **sz** length of the input data to append

See:

- `wc_InitBlake2b`
- `wc_Blake2bFinal`

Return:

- 0 Returned upon successfully update the Blake2b structure with the given data
- -1 Returned if there is a failure while compressing the input data

Example

```
int ret;
Blake2b b2b;
// initialize Blake2b structure with 64 byte digest
wc_InitBlake2b(&b2b, 64);

byte plain[] = { // initialize input };

ret = wc_Blake2bUpdate(&b2b, plain, sizeof(plain));
if( ret != 0) {
    // error updating blake2b
}
```

18.15.2.3 function `wc_Blake2bFinal`

```
WOLFSSL_API int wc_Blake2bFinal(
    Blake2b * ,
    byte * ,
    word32
)
```

This function computes the Blake2b hash of the previously supplied input data. The output hash will be of length `requestSz`, or, if `requestSz==0`, the `digestSz` of the `b2b` structure. This function should be called after `wc_InitBlake2b` and `wc_Blake2bUpdate` has been processed for each piece of input data desired.

Parameters:

- **b2b** pointer to the Blake2b structure to update
- **final** pointer to a buffer in which to store the blake2b hash. Should be of length `requestSz`
- **requestSz** length of the digest to compute. When this is zero, `b2b->digestSz` will be used instead

See:

- `wc_InitBlake2b`

- `wc_Blake2bUpdate`

Return:

- 0 Returned upon successfully computing the Blake2b hash
- -1 Returned if there is a failure while parsing the Blake2b hash

Example

```
int ret;
Blake2b b2b;
byte hash[64];
// initialize Blake2b structure with 64 byte digest
wc_InitBlake2b(&b2b, 64);
... // call wc_Blake2bUpdate to add data to hash

ret = wc_Blake2bFinal(&b2b, hash, 64);
if( ret != 0) {
    // error generating blake2b hash
}
```

18.16 Algorithms - Camellia

18.16.1 Functions

	Name	
WOLFSSL_API int	wc_CamelliaSetKey	(Camellia * cam, const byte * key, word32 len, const byte * iv)This function sets the key and initialization vector for a camellia object, initializing it for use as a cipher.
WOLFSSL_API int	wc_CamelliaSetIV	(Camellia * cam, const byte * iv)This function sets the initialization vector for a camellia object, initializing it for use as a cipher.
WOLFSSL_API int	wc_CamelliaEncryptDirect	(Camellia * cam, byte * out, const byte * in)This function does a one-time pad encryption of the input data using the key and initialization vector.
WOLFSSL_API int	wc_CamelliaDecryptDirect	(Camellia * cam, byte * out, const byte * in)This function does a one-time pad decryption of the input data using the key and initialization vector.
WOLFSSL_API int	wc_CamelliaCbcEncrypt	(Camellia * cam, byte * out, const byte * in, word32 sz)This function encrypts the input data using the key and initialization vector in CBC mode.
WOLFSSL_API int	wc_CamelliaCbcDecrypt	(Camellia * cam, byte * out, const byte * in, word32 sz)This function decrypts the input data using the key and initialization vector in CBC mode.

18.16.2 Functions Documentation

18.16.2.1 function wc_CamelliaSetKey

```
WOLFSSL_API int wc_CamelliaSetKey(
    Camellia * cam,
    const byte * key,
    word32 len,
    const byte * iv
)
```

This function sets the key and initialization vector for a camellia object, initializing it for use as a cipher.

Parameters:

- **cam** pointer to the camellia structure on which to set the key and iv
- **key** pointer to the buffer containing the 16, 24, or 32 byte key to use for encryption and decryption
- **len** length of the key passed in
- **iv** pointer to the buffer containing the 16 byte initialization vector for use with this camellia structure

See:

- `wc_CamelliaEncryptDirect`

- [wc_CamelliaDecryptDirect](#)
- [wc_CamelliaCbcEncrypt](#)
- [wc_CamelliaCbcDecrypt](#)

Return:

- 0 Returned upon successfully setting the key and initialization vector
- BAD_FUNC_ARG returned if there is an error processing one of the input arguments
- MEMORY_E returned if there is an error allocating memory with XMALLOC

Example

```
Camellia cam;
byte key[32];
// initialize key
byte iv[16];
// initialize iv
if( wc_CamelliaSetKey(&cam, key, sizeof(key), iv) != 0) {
    // error initializing camellia structure
}
```

18.16.2.2 function wc_CamelliaSetIV

```
WOLFSSL_API int wc_CamelliaSetIV(
    Camellia * cam,
    const byte * iv
)
```

This function sets the initialization vector for a camellia object.

Parameters:

- **cam** pointer to the camellia structure on which to set the iv
- **iv** pointer to the buffer containing the 16 byte initialization vector for use with this camellia structure

See: [wc_CamelliaSetKey](#)

Return:

- 0 Returned upon successfully setting the key and initialization vector
- BAD_FUNC_ARG returned if there is an error processing one of the input arguments

Example

```
Camellia cam;
byte iv[16];
// initialize iv
if( wc_CamelliaSetIV(&cam, iv) != 0) {
    // error initializing camellia structure
}
```

18.16.2.3 function wc_CamelliaEncryptDirect

```
WOLFSSL_API int wc_CamelliaEncryptDirect(
    Camellia * cam,
    byte * out,
    const byte * in
)
```

This function does a one-block encrypt using the provided camellia object. It parses the first 16 byte block from the buffer in and stores the encrypted result in the buffer out. Before using this function, one should initialize the camellia object using `wc_CamelliaSetKey`.

Parameters:

- **cam** pointer to the camellia structure to use for encryption
- **out** pointer to the buffer in which to store the encrypted block
- **in** pointer to the buffer containing the plaintext block to encrypt

See: [wc_CamelliaDecryptDirect](#)

Return: none No returns.

Example

```
Camellia cam;
// initialize cam structure with key and iv
byte plain[] = { // initialize with message to encrypt };
byte cipher[16];

wc_CamelliaEncryptDirect(&ca, cipher, plain);
```

18.16.2.4 function `wc_CamelliaDecryptDirect`

```
WOLFSSL_API int wc_CamelliaDecryptDirect(
    Camellia * cam,
    byte * out,
    const byte * in
)
```

This function does a one-block decrypt using the provided camellia object. It parses the first 16 byte block from the buffer in, decrypts it, and stores the result in the buffer out. Before using this function, one should initialize the camellia object using `wc_CamelliaSetKey`.

Parameters:

- **cam** pointer to the camellia structure to use for encryption
- **out** pointer to the buffer in which to store the decrypted plaintext block
- **in** pointer to the buffer containing the ciphertext block to decrypt

See: [wc_CamelliaEncryptDirect](#)

Return: none No returns.

Example

```
Camellia cam;
// initialize cam structure with key and iv
byte cipher[] = { // initialize with encrypted message to decrypt };
byte decrypted[16];

wc_CamelliaDecryptDirect(&cam, decrypted, cipher);
```

18.16.2.5 function `wc_CamelliaCbcEncrypt`

```
WOLFSSL_API int wc_CamelliaCbcEncrypt(
    Camellia * cam,
    byte * out,
    const byte * in,
    word32 sz
)
```

)

This function encrypts the plaintext from the buffer in and stores the output in the buffer out. It performs this encryption using Camellia with Cipher Block Chaining (CBC).

Parameters:

- **cam** pointer to the camellia structure to use for encryption
- **out** pointer to the buffer in which to store the encrypted ciphertext
- **in** pointer to the buffer containing the plaintext to encrypt
- **sz** the size of the message to encrypt

See: [wc_CamelliaCbcDecrypt](#)

Return: none No returns.

Example

```
Camellia cam;  
// initialize cam structure with key and iv  
byte plain[] = { // initialize with encrypted message to decrypt };  
byte cipher[sizeof(plain)];  
  
wc_CamelliaCbcEncrypt(&cam, cipher, plain, sizeof(plain));
```

18.16.2.6 function wc_CamelliaCbcDecrypt

```
WOLFSSL_API int wc_CamelliaCbcDecrypt(  
    Camellia * cam,  
    byte * out,  
    const byte * in,  
    word32 sz  
)
```

This function decrypts the ciphertext from the buffer in and stores the output in the buffer out. It performs this decryption using Camellia with Cipher Block Chaining (CBC).

Parameters:

- **cam** pointer to the camellia structure to use for encryption
- **out** pointer to the buffer in which to store the decrypted message
- **in** pointer to the buffer containing the encrypted ciphertext
- **sz** the size of the message to encrypt

See: [wc_CamelliaCbcEncrypt](#)

Return: none No returns.

Example

```
Camellia cam;  
// initialize cam structure with key and iv  
byte cipher[] = { // initialize with encrypted message to decrypt };  
byte decrypted[sizeof(cipher)];  
  
wc_CamelliaCbcDecrypt(&cam, decrypted, cipher, sizeof(cipher));
```

18.17.2 Functions Documentation

18.17.2.1 function wc_Chacha_SetIV

```
WOLFSSL_API int wc_Chacha_SetIV(
    ChaCha * ctx,
    const byte * inIv,
    word32 counter
)
```

This function sets the initialization vector (nonce) for a ChaCha object, initializing it for use as a cipher. It should be called after the key has been set, using wc_Chacha_SetKey. A difference nonce should be used for each round of encryption.

Parameters:

- **ctx** pointer to the ChaCha structure on which to set the iv
- **inIv** pointer to a buffer containing the 12 byte initialization vector with which to initialize the ChaCha structure
- **counter** the value at which the block counter should start—usually zero.

See:

- [wc_Chacha_SetKey](#)
- [wc_Chacha_Process](#)

Return:

- 0 Returned upon successfully setting the initialization vector
- BAD_FUNC_ARG returned if there is an error processing the ctx input argument

Example

```
ChaCha enc;
// initialize enc with wc_Chacha_SetKey
byte iv[12];
// initialize iv
if( wc_Chacha_SetIV(&enc, iv, 0) != 0) {
    // error initializing ChaCha structure
}
```

18.17.2.2 function wc_Chacha_Process

```
WOLFSSL_API int wc_Chacha_Process(
    ChaCha * ctx,
    byte * cipher,
    const byte * plain,
    word32 msglen
)
```

This function processes the text from the buffer input, encrypts or decrypts it, and stores the result in the buffer output.

Parameters:

- **ctx** pointer to the ChaCha structure on which to set the iv
- **output** pointer to a buffer in which to store the output ciphertext or decrypted plaintext
- **input** pointer to the buffer containing the input plaintext to encrypt or the input ciphertext to decrypt
- **msglen** length of the message to encrypt or the ciphertext to decrypt

See:

- [wc_Chacha_SetKey](#)
- [wc_Chacha_Process](#)

Return:

- 0 Returned upon successfully encrypting or decrypting the input
- BAD_FUNC_ARG returned if there is an error processing the ctx input argument

Example

```
ChaCha enc;
// initialize enc with wc_Chacha_SetKey and wc_Chacha_SetIV

byte plain[] = { // initialize plaintext };
byte cipher[sizeof(plain)];
if( wc_Chacha_Process(&enc, cipher, plain, sizeof(plain)) != 0) {
    // error processing ChaCha cipher
}
```

18.17.2.3 function wc_Chacha_SetKey

```
WOLFSSL_API int wc_Chacha_SetKey(
    ChaCha * ctx,
    const byte * key,
    word32 keySz
)
```

This function sets the key for a ChaCha object, initializing it for use as a cipher. It should be called before setting the nonce with wc_Chacha_SetIV, and before using it for encryption with wc_Chacha_Process.

Parameters:

- **ctx** pointer to the ChaCha structure in which to set the key
- **key** pointer to a buffer containing the 16 or 32 byte key with which to initialize the ChaCha structure
- **keySz** the length of the key passed in

See:

- [wc_Chacha_SetIV](#)
- [wc_Chacha_Process](#)

Return:

- 0 Returned upon successfully setting the key
- BAD_FUNC_ARG returned if there is an error processing the ctx input argument or if the key is not 16 or 32 bytes long

Example

```
ChaCha enc;
byte key[] = { // initialize key };

if( wc_Chacha_SetKey(&enc, key, sizeof(key)) != 0) {
```

```

    // error initializing ChaCha structure
}

```

18.18 Algorithms - ChaCha20_Poly1305

18.18.1 Functions

	Name
WOLFSSL_API int	wc_Chacha20Poly1305_Encrypt (const byte inKey[CHACHA20_POLY1305_AEAD_KEYSIZE], const b
WOLFSSL_API int	wc_Chacha20Poly1305_Decrypt (const byte inKey[CHACHA20_POLY1305_AEAD_KEYSIZE], const b

18.18.2 Functions Documentation

18.18.2.1 function wc_Chacha20Poly1305_Encrypt

```

WOLFSSL_API int wc_Chacha20Poly1305_Encrypt(
    const byte inKey[CHACHA20_POLY1305_AEAD_KEYSIZE],
    const byte inIV[CHACHA20_POLY1305_AEAD_IV_SIZE],
    const byte * inAAD,
    const word32 inAADLen,
    const byte * inPlaintext,
    const word32 inPlaintextLen,
    byte * outCiphertext,
    byte outAuthTag[CHACHA20_POLY1305_AEAD_AUTHTAG_SIZE]
)

```

This function encrypts an input message, inPlaintext, using the ChaCha20 stream cipher, into the output buffer, outCiphertext. It also performs Poly-1305 authentication (on the cipher text), and stores the generated authentication tag in the output buffer, outAuthTag.

Parameters:

- **inKey** pointer to a buffer containing the 32 byte key to use for encryption
- **inIV** pointer to a buffer containing the 12 byte iv to use for encryption
- **inAAD** pointer to the buffer containing arbitrary length additional authenticated data (AAD)
- **inAADLen** length of the input AAD
- **inPlaintext** pointer to the buffer containing the plaintext to encrypt
- **inPlaintextLen** the length of the plain text to encrypt
- **outCiphertext** pointer to the buffer in which to store the ciphertext
- **outAuthTag** pointer to a 16 byte wide buffer in which to store the authentication tag

See:

- **wc_Chacha20Poly1305_Decrypt**
- wc_Chacha_*
- wc_Poly1305*

Return:

- 0 Returned upon successfully encrypting the message
- BAD_FUNC_ARG returned if there is an error during the encryption process

Example

```

byte key[] = { // initialize 32 byte key };
byte iv[] = { // initialize 12 byte key };
byte inAAD[] = { // initialize AAD };

```

```

byte plain[] = { // initialize message to encrypt };
byte cipher[sizeof(plain)];
byte authTag[16];

int ret = wc_Chacha20Poly1305_Encrypt(key, iv, inAAD, sizeof(inAAD),
plain, sizeof(plain), cipher, authTag);

if(ret != 0) {
    // error running encrypt
}

```

18.18.2.2 function wc_Chacha20Poly1305_Decrypt

```

WOLFSSL_API int wc_Chacha20Poly1305_Decrypt(
    const byte inKey[CHACHA20_POLY1305_AEAD_KEYSIZE],
    const byte inIV[CHACHA20_POLY1305_AEAD_IV_SIZE],
    const byte * inAAD,
    const word32 inAADLen,
    const byte * inCiphertext,
    const word32 inCiphertextLen,
    const byte inAuthTag[CHACHA20_POLY1305_AEAD_AUTHTAG_SIZE],
    byte * outPlaintext
)

```

This function decrypts input ciphertext, `inCiphertext`, using the ChaCha20 stream cipher, into the output buffer, `outPlaintext`. It also performs Poly-1305 authentication, comparing the given `inAuthTag` to an authentication generated with the `inAAD` (arbitrary length additional authenticated data). Note: If the generated authentication tag does not match the supplied authentication tag, the text is not decrypted.

Parameters:

- **inKey** pointer to a buffer containing the 32 byte key to use for decryption
- **inIV** pointer to a buffer containing the 12 byte iv to use for decryption
- **inAAD** pointer to the buffer containing arbitrary length additional authenticated data (AAD)
- **inAADLen** length of the input AAD
- **inCiphertext** pointer to the buffer containing the ciphertext to decrypt
- **outCiphertextLen** the length of the ciphertext to decrypt
- **inAuthTag** pointer to the buffer containing the 16 byte digest for authentication
- **outPlaintext** pointer to the buffer in which to store the plaintext

See:

- [wc_Chacha20Poly1305_Encrypt](#)
- `wc_Chacha_*`
- `wc_Poly1305*`

Return:

- 0 Returned upon successfully decrypting the message
- `BAD_FUNC_ARG` Returned if any of the function arguments do not match what is expected
- `MAC_CMP_FAILED_E` Returned if the generated authentication tag does not match the supplied `inAuthTag`.

Example

```

byte key[] = { // initialize 32 byte key };
byte iv[] = { // initialize 12 byte key };

```

```

byte inAAD[] = { // initialize AAD };

byte cipher[] = { // initialize with received ciphertext };
byte authTag[16] = { // initialize with received authentication tag };

byte plain[sizeof(cipher)];

int ret = wc_ChaCha20Poly1305_Decrypt(key, iv, inAAD, sizeof(inAAD),
cipher, sizeof(cipher), plain, authTag);

if(ret == MAC_CMP_FAILED_E) {
    // error during authentication
} else if( ret != 0) {
    // error with function arguments
}

```

18.20.1 Functions

	Name
WOLFSSL_API int	wc_curve25519_make_key (WC_RNG * rng, int keysize, curve25519_key * key)This function generates a Curve25519 key using the given random number generator, rng, of the size keysize.
WOLFSSL_API int	wc_curve25519_shared_secret (curve25519_key * private_key, curve25519_key * public_key, byte * out, word32 * outLen)This function calculates the shared secret between two Curve25519 keys.
WOLFSSL_API int	wc_curve25519_shared_secret_ex (curve25519_key * private_key, curve25519_key * public_key, byte * out, word32 * outLen, int endian)This function calculates the shared secret between two Curve25519 keys, using the given endianess.
WOLFSSL_API int	wc_curve25519_init (curve25519_key * key)This function initializes a Curve25519 key. It should be called before any other function in this module.
WOLFSSL_API void	wc_curve25519_free (curve25519_key * key)This function frees a Curve25519 object.
WOLFSSL_API int	wc_curve25519_import_private (const byte * priv, word32 privSz, curve25519_key * key)This function imports a private key into a Curve25519 key object.
WOLFSSL_API int	wc_curve25519_import_private_ex (const byte * priv, word32 privSz, curve25519_key * key, int endian)This function imports a private key into a Curve25519 key object, using the given endianess.
WOLFSSL_API int	wc_curve25519_import_private_raw (const byte * priv, word32 privSz, const byte * pub, word32 pubSz, curve25519_key * key)This function imports a private key and a public key into a Curve25519 key object.
WOLFSSL_API int	wc_curve25519_import_private_raw_ex (const byte * priv, word32 privSz, const byte * pub, word32 pubSz, curve25519_key * key, int endian)This function imports a private key and a public key into a Curve25519 key object, using the given endianess.
WOLFSSL_API int	wc_curve25519_export_private_raw (curve25519_key * key, byte * out, word32 * outLen)This function exports the private key of a Curve25519 key object.
WOLFSSL_API int	wc_curve25519_export_private_raw_ex (curve25519_key * key, byte * out, word32 * outLen, int endian)This function exports the private key of a Curve25519 key object, using the given endianess.
WOLFSSL_API int	wc_curve25519_import_public (const byte * in, word32 inLen, curve25519_key * key)This function imports a public key into a Curve25519 key object.
WOLFSSL_API int	wc_curve25519_import_public_ex (const byte * in, word32 inLen, curve25519_key * key, int endian)This function imports a public key into a Curve25519 key object, using the given endianess.
WOLFSSL_API int	wc_curve25519_check_public (const byte * pub, word32 pubSz, int endian)This function checks if a public key is valid.
WOLFSSL_API int	wc_curve25519_export_public (curve25519_key * key, byte * out, word32 * outLen)This function exports the public key of a Curve25519 key object.
WOLFSSL_API int	wc_curve25519_export_public_ex (curve25519_key * key, byte * out, word32 * outLen, int endian)This function exports the public key of a Curve25519 key object, using the given endianess.
WOLFSSL_API int	wc_curve25519_export_key_raw (curve25519_key * key, byte * priv, word32 * privSz, byte * pub, word32 * pubSz)This function exports the private and public keys of a Curve25519 key object.
WOLFSSL_API int	wc_curve25519_export_key_raw_ex (curve25519_key * key, byte * priv, word32 * privSz, byte * pub, word32 * pubSz, int endian)This function exports the private and public keys of a Curve25519 key object, using the given endianess.
WOLFSSL_API int	wc_curve25519_size (curve25519_key * key)This function returns the key size of the given key object.

18.20.2 Functions Documentation

18.20.2.1 function wc_curve25519_make_key

```

WOLFSSL_API int wc_curve25519_make_key(
    WC_RNG * rng,
    int keysize,
    curve25519_key * key
)

```

This function generates a Curve25519 key using the given random number generator, rng, of the size

given (keysize), and stores it in the given curve25519_key structure. It should be called after the key structure has been initialized through wc_curve25519_init().

Parameters:

- **rng** Pointer to the RNG object used to generate the ecc key.
- **keysize** Size of the key to generate. Must be 32 bytes for curve25519.
- **key** Pointer to the curve25519_key structure in which to store the generated key.

See: [wc_curve25519_init](#)

Return:

- 0 Returned on successfully generating the key and storing it in the given curve25519_key structure.
- ECC_BAD_ARG_E Returned if the input keysize does not correspond to the keysize for a curve25519 key (32 bytes).
- RNG_FAILURE_E Returned if the rng internal status is not DRBG_OK or if there is in generating the next random block with rng.
- BAD_FUNC_ARG Returned if any of the input parameters passed in are NULL.

Example

```
int ret;

curve25519_key key;
wc_curve25519_init(&key); // initialize key
WC_RNG rng;
wc_InitRng(&rng); // initialize random number generator

ret = wc_curve25519_make_key(&rng, 32, &key);
if (ret != 0) {
    // error making Curve25519 key
}
```

18.20.2.2 function wc_curve25519_shared_secret

```
WOLFSSL_API int wc_curve25519_shared_secret(
    curve25519_key * private_key,
    curve25519_key * public_key,
    byte * out,
    word32 * outlen
)
```

This function computes a shared secret key given a secret private key and a received public key. It stores the generated secret key in the buffer out and assigns the variable of the secret key to outlen. Only supports big endian.

Parameters:

- **private_key** Pointer to the curve25519_key structure initialized with the user's private key.
- **public_key** Pointer to the curve25519_key structure containing the received public key.
- **out** Pointer to a buffer in which to store the 32 byte computed secret key.
- **outlen** Pointer in which to store the length written to the output buffer.

See:

- [wc_curve25519_init](#)
- [wc_curve25519_make_key](#)
- [wc_curve25519_shared_secret_ex](#)

Return:

- 0 Returned on successfully computing a shared secret key.
- BAD_FUNC_ARG Returned if any of the input parameters passed in are NULL.
- ECC_BAD_ARG_E Returned if the first bit of the public key is set, to avoid implementation fingerprinting.

Example

```
int ret;

byte sharedKey[32];
word32 keySz;
curve25519_key privKey, pubKey;
// initialize both keys

ret = wc_curve25519_shared_secret(&privKey, &pubKey, sharedKey, &keySz);
if (ret != 0) {
    // error generating shared key
}
```

18.20.2.3 function wc_curve25519_shared_secret_ex

```
WOLFSSL_API int wc_curve25519_shared_secret_ex(
    curve25519_key * private_key,
    curve25519_key * public_key,
    byte * out,
    word32 * outlen,
    int endian
)
```

This function computes a shared secret key given a secret private key and a received public key. It stores the generated secret key in the buffer out and assigns the variable of the secret key to outlen. Supports both big and little endian.

Parameters:

- **private_key** Pointer to the curve25519_key structure initialized with the user's private key.
- **public_key** Pointer to the curve25519_key structure containing the received public key.
- **out** Pointer to a buffer in which to store the 32 byte computed secret key.
- **pinout]** outlen Pointer in which to store the length written to the output buffer.
- **endian** EC25519_BIG_ENDIAN or EC25519_LITTLE_ENDIAN to set which form to use.

See:

- [wc_curve25519_init](#)
- [wc_curve25519_make_key](#)
- [wc_curve25519_shared_secret](#)

Return:

- 0 Returned on successfully computing a shared secret key.
- BAD_FUNC_ARG Returned if any of the input parameters passed in are NULL.
- ECC_BAD_ARG_E Returned if the first bit of the public key is set, to avoid implementation fingerprinting.

Example

```
int ret;
```

```

byte sharedKey[32];
word32 keySz;

curve25519_key privKey, pubKey;
// initialize both keys

ret = wc_curve25519_shared_secret_ex(&privKey, &pubKey, sharedKey, &keySz,
                                     EC25519_BIG_ENDIAN);
if (ret != 0) {
    // error generating shared key
}

```

18.20.2.4 function wc_curve25519_init

```

WOLFSSL_API int wc_curve25519_init(
    curve25519_key * key
)

```

This function initializes a Curve25519 key. It should be called before generating a key for the structure.

Parameters:

- **key** Pointer to the curve25519_key structure to initialize.

See: [wc_curve25519_make_key](#)

Return:

- 0 Returned on successfully initializing the curve25519_key structure.
- BAD_FUNC_ARG Returned when key is NULL.

Example

```

curve25519_key key;
wc_curve25519_init(&key); // initialize key
// make key and proceed to encryption

```

18.20.2.5 function wc_curve25519_free

```

WOLFSSL_API void wc_curve25519_free(
    curve25519_key * key
)

```

This function frees a Curve25519 object.

Parameters:

- **key** Pointer to the key object to free.

See:

- [wc_curve25519_init](#)
- [wc_curve25519_make_key](#)

Example

```

curve25519_key privKey;
// initialize key, use it to generate shared secret key
wc_curve25519_free(&privKey);

```

18.20.2.6 function `wc_curve25519_import_private`

```
WOLFSSL_API int wc_curve25519_import_private(  
    const byte * priv,  
    word32 privSz,  
    curve25519_key * key  
)
```

This function imports a curve25519 private key only. (Big endian).

Parameters:

- **priv** Pointer to a buffer containing the private key to import.
- **privSz** Length of the private key to import.
- **key** Pointer to the structure in which to store the imported key.

See:

- [wc_curve25519_import_private_ex](#)
- [wc_curve25519_size](#)

Return:

- 0 Returned on successfully importing private key.
- BAD_FUNC_ARG Returns if key or priv is null.
- ECC_BAD_ARG_E Returns if privSz is not equal to CURVE25519_KEY_SIZE.

Example

```
int ret;  
  
byte priv[] = { Contents of private key };  
curve25519_key key;  
wc_curve25519_init(&key);  
  
ret = wc_curve25519_import_private(priv, sizeof(priv), &key);  
if (ret != 0) {  
    // error importing keys  
}
```

18.20.2.7 function `wc_curve25519_import_private_ex`

```
WOLFSSL_API int wc_curve25519_import_private_ex(  
    const byte * priv,  
    word32 privSz,  
    curve25519_key * key,  
    int endian  
)
```

curve25519 private key import only. (Big or Little endian).

Parameters:

- **priv** Pointer to a buffer containing the private key to import.
- **privSz** Length of the private key to import.
- **key** Pointer to the structure in which to store the imported key.
- **endian** EC25519_BIG_ENDIAN or EC25519_LITTLE_ENDIAN to set which form to use.

See:

- [wc_curve25519_import_private](#)
- [wc_curve25519_size](#)

Return:

- 0 Returned on successfully importing private key.
- BAD_FUNC_ARG Returns if key or priv is null.
- ECC_BAD_ARG_E Returns if privSz is not equal to CURVE25519_KEY_SIZE.

Example

```
int ret;

byte priv[] = { // Contents of private key };
curve25519_key key;
wc_curve25519_init(&key);

ret = wc_curve25519_import_private_ex(priv, sizeof(priv), &key,
    EC25519_BIG_ENDIAN);
if (ret != 0) {
    // error importing keys
}
```

18.20.2.8 function wc_curve25519_import_private_raw

```
WOLFSSL_API int wc_curve25519_import_private_raw(
    const byte * priv,
    word32 privSz,
    const byte * pub,
    word32 pubSz,
    curve25519_key * key
)
```

This function imports a public-private key pair into a curve25519_key structure. Big endian only.

Parameters:

- **priv** Pointer to a buffer containing the private key to import.
- **privSz** Length of the private key to import.
- **pub** Pointer to a buffer containing the public key to import.
- **pubSz** Length of the public key to import.
- **key** Pointer to the structure in which to store the imported keys.

See:

- [wc_curve25519_init](#)
- [wc_curve25519_make_key](#)
- [wc_curve25519_import_public](#)
- [wc_curve25519_export_private_raw](#)

Return:

- 0 Returned on importing into the curve25519_key structure
- BAD_FUNC_ARG Returns if any of the input parameters are null.
- ECC_BAD_ARG_E Returned if the input key's key size does not match the public or private key sizes.

Example

```
int ret;

byte priv[32];
byte pub[32];
```

```

// initialize with public and private keys
curve25519_key key;

wc_curve25519_init(&key);
// initialize key

ret = wc_curve25519_import_private_raw(&priv, sizeof(priv), pub,
    sizeof(pub), &key);
if (ret != 0) {
    // error importing keys
}

```

18.20.2.9 function wc_curve25519_import_private_raw_ex

```

WOLFSSL_API int wc_curve25519_import_private_raw_ex(
    const byte * priv,
    word32 privSz,
    const byte * pub,
    word32 pubSz,
    curve25519_key * key,
    int endian
)

```

This function imports a public-private key pair into a curve25519_key structure. Supports both big and little endian.

Parameters:

- **priv** Pointer to a buffer containing the private key to import.
- **privSz** Length of the private key to import.
- **pub** Pointer to a buffer containing the public key to import.
- **pubSz** Length of the public key to import.
- **key** Pointer to the structure in which to store the imported keys.
- **endian** EC25519_BIG_ENDIAN or EC25519_LITTLE_ENDIAN to set which form to use.

See:

- [wc_curve25519_init](#)
- [wc_curve25519_make_key](#)
- [wc_curve25519_import_public](#)
- [wc_curve25519_export_private_raw](#)
- [wc_curve25519_import_private_raw](#)

Return:

- 0 Returned on importing into the curve25519_key structure
- BAD_FUNC_ARG Returns if any of the input parameters are null.
- ECC_BAD_ARG_E Returned if or the input key's key size does not match the public or private key sizes

Example

```

int ret;
byte priv[32];
byte pub[32];
// initialize with public and private keys
curve25519_key key;

wc_curve25519_init(&key);

```

```

// initialize key

ret = wc_curve25519_import_private_raw_ex(&priv, sizeof(priv), pub,
    sizeof(pub), &key, EC25519_BIG_ENDIAN);
if (ret != 0) {
    // error importing keys
}

```

18.20.2.10 function `wc_curve25519_export_private_raw`

```

WOLFSSL_API int wc_curve25519_export_private_raw(
    curve25519_key * key,
    byte * out,
    word32 * outLen
)

```

This function exports a private key from a `curve25519_key` structure and stores it in the given out buffer. It also sets `outLen` to be the size of the exported key. Big Endian only.

Parameters:

- **key** Pointer to the structure from which to export the key.
- **out** Pointer to the buffer in which to store the exported key.
- **outLen** On in, is the size of the out in bytes. On out, will store the bytes written to the output buffer.

See:

- `wc_curve25519_init`
- `wc_curve25519_make_key`
- `wc_curve25519_import_private_raw`
- `wc_curve25519_export_private_raw_ex`

Return:

- 0 Returned on successfully exporting the private key from the `curve25519_key` structure.
- `BAD_FUNC_ARG` Returned if any input parameters are NULL.
- `ECC_BAD_ARG_E` Returned if `wc_curve25519_size()` is not equal to key.

Example

```

int ret;
byte priv[32];
int privSz;

curve25519_key key;
// initialize and make key

ret = wc_curve25519_export_private_raw(&key, priv, &privSz);
if (ret != 0) {
    // error exporting key
}

```

18.20.2.11 function `wc_curve25519_export_private_raw_ex`

```

WOLFSSL_API int wc_curve25519_export_private_raw_ex(
    curve25519_key * key,
    byte * out,
    word32 * outLen,

```

```
    int endian
)
```

This function exports a private key from a `curve25519_key` structure and stores it in the given out buffer. It also sets `outLen` to be the size of the exported key. Can specify whether it's big or little endian.

Parameters:

- **key** Pointer to the structure from which to export the key.
- **out** Pointer to the buffer in which to store the exported key.
- **outLen** On in, is the size of the out in bytes. On out, will store the bytes written to the output buffer.
- **endian** `EC25519_BIG_ENDIAN` or `EC25519_LITTLE_ENDIAN` to set which form to use.

See:

- `wc_curve25519_init`
- `wc_curve25519_make_key`
- `wc_curve25519_import_private_raw`
- `wc_curve25519_export_private_raw`
- `wc_curve25519_size`

Return:

- 0 Returned on successfully exporting the private key from the `curve25519_key` structure.
- `BAD_FUNC_ARG` Returned if any input parameters are NULL.
- `ECC_BAD_ARG_E` Returned if `wc_curve25519_size()` is not equal to key.

Example

```
int ret;

byte priv[32];
int privSz;
curve25519_key key;
// initialize and make key
ret = wc_curve25519_export_private_raw_ex(&key, priv, &privSz,
    EC25519_BIG_ENDIAN);
if (ret != 0) {
    // error exporting key
}
```

18.20.2.12 function `wc_curve25519_import_public`

```
WOLFSSL_API int wc_curve25519_import_public(
    const byte * in,
    word32 inLen,
    curve25519_key * key
)
```

This function imports a public key from the given in buffer and stores it in the `curve25519_key` structure.

Parameters:

- **in** Pointer to the buffer containing the public key to import.
- **inLen** Length of the public key to import.
- **key** Pointer to the `curve25519_key` structure in which to store the key.

See:

- `wc_curve25519_init`
- `wc_curve25519_export_public`
- `wc_curve25519_import_private_raw`
- `wc_curve25519_import_public_ex`
- `wc_curve25519_check_public`
- `wc_curve25519_size`

Return:

- 0 Returned on successfully importing the public key into the `curve25519_key` structure.
- `ECC_BAD_ARG_E` Returned if the `inLen` parameter does not match the key size of the key structure.
- `BAD_FUNC_ARG` Returned if any of the input parameters are NULL.

Example

```
int ret;

byte pub[32];
// initialize pub with public key

curve25519_key key;
// initialize key

ret = wc_curve25519_import_public(pub, sizeof(pub), &key);
if (ret != 0) {
    // error importing key
}
```

18.20.2.13 function `wc_curve25519_import_public_ex`

```
WOLFSSL_API int wc_curve25519_import_public_ex(
    const byte * in,
    word32 inLen,
    curve25519_key * key,
    int endian
)
```

This function imports a public key from the given in buffer and stores it in the `curve25519_key` structure.

Parameters:

- **in** Pointer to the buffer containing the public key to import.
- **inLen** Length of the public key to import.
- **key** Pointer to the `curve25519_key` structure in which to store the key.
- **endian** `EC25519_BIG_ENDIAN` or `EC25519_LITTLE_ENDIAN` to set which form to use.

See:

- `wc_curve25519_init`
- `wc_curve25519_export_public`
- `wc_curve25519_import_private_raw`
- `wc_curve25519_import_public`
- `wc_curve25519_check_public`
- `wc_curve25519_size`

Return:

- 0 Returned on successfully importing the public key into the `curve25519_key` structure.

- **ECC_BAD_ARG_E** Returned if the `inLen` parameter does not match the key size of the key structure.
- **BAD_FUNC_ARG** Returned if any of the input parameters are NULL.

Example

```
int ret;

byte pub[32];
// initialize pub with public key
curve25519_key key;
// initialize key

ret = wc_curve25519_import_public_ex(pub, sizeof(pub), &key,
                                     EC25519_BIG_ENDIAN);
if (ret != 0) {
    // error importing key
}
```

18.20.2.14 function `wc_curve25519_check_public`

```
WOLFSSL_API int wc_curve25519_check_public(
    const byte * pub,
    word32 pubSz,
    int endian
)
```

This function checks that a public key buffer holds a valid Curve25519 key value given the endian ordering.

Parameters:

- **pub** Pointer to the buffer containing the public key to check.
- **pubLen** Length of the public key to check.
- **endian** `EC25519_BIG_ENDIAN` or `EC25519_LITTLE_ENDIAN` to set which form to use.

See:

- `wc_curve25519_init`
- `wc_curve25519_import_public`
- `wc_curve25519_import_public_ex`
- `wc_curve25519_size`

Return:

- 0 Returned when the public key value is valid.
- **ECC_BAD_ARG_E** Returned if the public key value is not valid.
- **BAD_FUNC_ARG** Returned if any of the input parameters are NULL.

Example

```
int ret;

byte pub[] = { Contents of public key };

ret = wc_curve25519_check_public_ex(pub, sizeof(pub), EC25519_BIG_ENDIAN);
if (ret != 0) {
    // error importing key
}
```

18.20.2.15 function `wc_curve25519_export_public`

```
WOLFSSL_API int wc_curve25519_export_public(  
    curve25519_key * key,  
    byte * out,  
    word32 * outLen  
)
```

This function exports a public key from the given key structure and stores the result in the out buffer. Big endian only.

Parameters:

- **key** Pointer to the `curve25519_key` structure in from which to export the key.
- **out** Pointer to the buffer in which to store the public key.
- **outLen** On in, is the size of the out in bytes. On out, will store the bytes written to the output buffer.

See:

- [wc_curve25519_init](#)
- [wc_curve25519_export_private_raw](#)
- [wc_curve25519_import_public](#)

Return:

- 0 Returned on successfully exporting the public key from the `curve25519_key` structure.
- `ECC_BAD_ARG_E` Returned if `outLen` is less than `CURVE25519_PUB_KEY_SIZE`.
- `BAD_FUNC_ARG` Returned if any of the input parameters are NULL.

Example

```
int ret;  
  
byte pub[32];  
int pubSz;  
  
curve25519_key key;  
// initialize and make key  
ret = wc_curve25519_export_public(&key, pub, &pubSz);  
if (ret != 0) {  
    // error exporting key  
}
```

18.20.2.16 function `wc_curve25519_export_public_ex`

```
WOLFSSL_API int wc_curve25519_export_public_ex(  
    curve25519_key * key,  
    byte * out,  
    word32 * outLen,  
    int endian  
)
```

This function exports a public key from the given key structure and stores the result in the out buffer. Supports both big and little endian.

Parameters:

- **key** Pointer to the `curve25519_key` structure in from which to export the key.
- **out** Pointer to the buffer in which to store the public key.

- **outLen** On in, is the size of the out in bytes. On out, will store the bytes written to the output buffer.
- **endian** EC25519_BIG_ENDIAN or EC25519_LITTLE_ENDIAN to set which form to use.

See:

- [wc_curve25519_init](#)
- [wc_curve25519_export_private_raw](#)
- [wc_curve25519_import_public](#)

Return:

- 0 Returned on successfully exporting the public key from the curve25519_key structure.
- ECC_BAD_ARG_E Returned if outLen is less than CURVE25519_PUB_KEY_SIZE.
- BAD_FUNC_ARG Returned if any of the input parameters are NULL.

Example

```
int ret;

byte pub[32];
int pubSz;

curve25519_key key;
// initialize and make key

ret = wc_curve25519_export_public_ex(&key, pub, &pubSz, EC25519_BIG_ENDIAN);
if (ret != 0) {
    // error exporting key
}
```

18.20.2.17 function wc_curve25519_export_key_raw

```
WOLFSSL_API int wc_curve25519_export_key_raw(
    curve25519_key * key,
    byte * priv,
    word32 * privSz,
    byte * pub,
    word32 * pubSz
)
```

Export Curve25519 key pair. Big endian only.

Parameters:

- **key** Pointer to the curve448_key structure in from which to export the key pair.
- **priv** Pointer to the buffer in which to store the private key.
- **privSz** On in, is the size of the priv buffer in bytes. On out, will store the bytes written to the priv buffer.
- **pub** Pointer to the buffer in which to store the public key.
- **pubSz** On in, is the size of the pub buffer in bytes. On out, will store the bytes written to the pub buffer.

See:

- [wc_curve25519_export_key_raw_ex](#)
- [wc_curve25519_export_private_raw](#)

Return:

- 0 Returned on successfully exporting the key pair from the curve25519_key structure.

- BAD_FUNC_ARG Returned if any input parameters are NULL.
- ECC_BAD_ARG_E Returned if privSz is less than CURVE25519_KEY_SIZE or pubSz is less than CURVE25519_PUB_KEY_SIZE.

Example

```
int ret;

byte pub[32];
byte priv[32];
int pubSz;
int privSz;

curve25519_key key;
// initialize and make key

ret = wc_curve25519_export_key_raw(&key, priv, &privSz, pub, &pubSz);
if (ret != 0) {
    // error exporting key
}
```

18.20.2.18 function wc_curve25519_export_key_raw_ex

```
WOLFSSL_API int wc_curve25519_export_key_raw_ex(
    curve25519_key * key,
    byte * priv,
    word32 * privSz,
    byte * pub,
    word32 * pubSz,
    int endian
)
```

Export curve25519 key pair. Big or little endian.

Parameters:

- **key** Pointer to the curve448_key structure in from which to export the key pair.
- **priv** Pointer to the buffer in which to store the private key.
- **privSz** On in, is the size of the priv buffer in bytes. On out, will store the bytes written to the priv buffer.
- **pub** Pointer to the buffer in which to store the public key.
- **pubSz** On in, is the size of the pub buffer in bytes. On out, will store the bytes written to the pub buffer.
- **endian** EC25519_BIG_ENDIAN or EC25519_LITTLE_ENDIAN to set which form to use.

See:

- [wc_curve25519_export_key_raw](#)
- [wc_curve25519_export_private_raw_ex](#)
- [wc_curve25519_export_public_ex](#)

Return:

- 0 Returned on successfully exporting the key pair from the curve25519_key structure.
- BAD_FUNC_ARG Returned if any input parameters are NULL.
- ECC_BAD_ARG_E Returned if privSz is less than CURVE25519_KEY_SIZE or pubSz is less than CURVE25519_PUB_KEY_SIZE.

Example

```

int ret;

byte pub[32];
byte priv[32];
int pubSz;
int privSz;

curve25519_key key;
// initialize and make key

ret = wc_curve25519_export_key_raw_ex(&key, priv, &privSz, pub, &pubSz,
    EC25519_BIG_ENDIAN);
if (ret != 0) {
    // error exporting key
}

```

18.20.2.19 function wc_curve25519_size

```

WOLFSSL_API int wc_curve25519_size(
    curve25519_key * key
)

```

This function returns the key size of the given key structure.

Parameters:

- **key** Pointer to the curve25519_key structure in for which to determine the key size.

See:

- [wc_curve25519_init](#)
- [wc_curve25519_make_key](#)

Return:

- Success Given a valid, initialized curve25519_key structure, returns the size of the key.
- 0 Returned if key is NULL

Example

```

int keySz;

curve25519_key key;
// initialize and make key

keySz = wc_curve25519_size(&key);

```

	Name
WOLFSSL_API int	wc_curve448_import_private_ex (const byte * priv, word32 privSz, curve448_key * key, int endian)
WOLFSSL_API int	wc_curve448_import_private_raw (const byte * priv, word32 privSz, const byte * pub, word32 pubSz, int endian)
WOLFSSL_API int	wc_curve448_import_private_raw_ex (const byte * priv, word32 privSz, const byte * pub, word32 pubSz, int endian)
WOLFSSL_API int	wc_curve448_export_private_raw (curve448_key * key, byte * out, word32 * outLen)This function exports the private key of the given key structure to the given output buffer.
WOLFSSL_API int	wc_curve448_export_private_raw_ex (curve448_key * key, byte * out, word32 * outLen, int endian)This function exports the private key of the given key structure to the given output buffer in the given endian format.
WOLFSSL_API int	wc_curve448_import_public (const byte * in, word32 inLen, curve448_key * key)This function imports the public key of the given key structure from the given input buffer.
WOLFSSL_API int	wc_curve448_import_public_ex (const byte * in, word32 inLen, curve448_key * key, int endian)This function imports the public key of the given key structure from the given input buffer in the given endian format.
WOLFSSL_API int	wc_curve448_check_public (const byte * pub, word32 pubSz, int endian)This function checks the given public key for validity.
WOLFSSL_API int	wc_curve448_export_public (curve448_key * key, byte * out, word32 * outLen)This function exports the public key of the given key structure to the given output buffer.
WOLFSSL_API int	wc_curve448_export_public_ex (curve448_key * key, byte * out, word32 * outLen, int endian)This function exports the public key of the given key structure to the given output buffer in the given endian format.
WOLFSSL_API int	wc_curve448_export_key_raw (curve448_key * key, byte * priv, word32 * privSz, byte * pub, word32 * pubSz)This function exports the raw key of the given key structure to the given output buffers.
WOLFSSL_API int	wc_curve448_export_key_raw_ex (curve448_key * key, byte * priv, word32 * privSz, byte * pub, word32 * pubSz, int endian)This function exports the raw key of the given key structure to the given output buffers in the given endian format.
WOLFSSL_API int	wc_curve448_size (curve448_key * key)This function returns the key size of the given key structure.

18.21.2 Functions Documentation

18.21.2.1 function wc_curve448_make_key

```
WOLFSSL_API int wc_curve448_make_key(
    WC_RNG * rng,
    int keysize,
    curve448_key * key
)
```

This function generates a Curve448 key using the given random number generator, rng, of the size given (keysize), and stores it in the given curve448_key structure. It should be called after the key structure has been initialized through wc_curve448_init().

Parameters:

- **rng** Pointer to the RNG object used to generate the ecc key.
- **keysize** Size of the key to generate. Must be 56 bytes for curve448.
- **key** Pointer to the curve448_key structure in which to store the generated key.

See: [wc_curve448_init](#)

Return:

- 0 Returned on successfully generating the key and storing it in the given curve448_key structure.
- ECC_BAD_ARG_E Returned if the input keysize does not correspond to the keysize for a curve448 key (56 bytes).
- RNG_FAILURE_E Returned if the rng internal status is not DRBG_OK or if there is in generating the next random block with rng.
- BAD_FUNC_ARG Returned if any of the input parameters passed in are NULL.

Example

```
int ret;

curve448_key key;
wc_curve448_init(&key); // initialize key
WC_RNG rng;
wc_InitRng(&rng); // initialize random number generator

ret = wc_curve448_make_key(&rng, 56, &key);
```

```

if (ret != 0) {
    // error making Curve448 key
}

```

18.21.2.2 function `wc_curve448_shared_secret`

```

WOLFSSL_API int wc_curve448_shared_secret(
    curve448_key * private_key,
    curve448_key * public_key,
    byte * out,
    word32 * outlen
)

```

This function computes a shared secret key given a secret private key and a received public key. It stores the generated secret key in the buffer out and assigns the variable of the secret key to outlen. Only supports big endian.

Parameters:

- **private_key** Pointer to the curve448_key structure initialized with the user's private key.
- **public_key** Pointer to the curve448_key structure containing the received public key.
- **out** Pointer to a buffer in which to store the 56 byte computed secret key.
- **outlen** Pointer in which to store the length written to the output buffer.

See:

- [wc_curve448_init](#)
- [wc_curve448_make_key](#)
- [wc_curve448_shared_secret_ex](#)

Return:

- 0 Returned on successfully computing a shared secret key
- BAD_FUNC_ARG Returned if any of the input parameters passed in are NULL

Example

```

int ret;

byte sharedKey[56];
word32 keySz;
curve448_key privKey, pubKey;
// initialize both keys

ret = wc_curve448_shared_secret(&privKey, &pubKey, sharedKey, &keySz);
if (ret != 0) {
    // error generating shared key
}

```

18.21.2.3 function `wc_curve448_shared_secret_ex`

```

WOLFSSL_API int wc_curve448_shared_secret_ex(
    curve448_key * private_key,
    curve448_key * public_key,
    byte * out,
    word32 * outlen,
    int endian
)

```

This function computes a shared secret key given a secret private key and a received public key. It stores the generated secret key in the buffer out and assigns the variable of the secret key to outlen. Supports both big and little endian.

Parameters:

- **private_key** Pointer to the curve448_key structure initialized with the user's private key.
- **public_key** Pointer to the curve448_key structure containing the received public key.
- **out** Pointer to a buffer in which to store the 56 byte computed secret key.
- **outlen** Pointer in which to store the length written to the output buffer.
- **endian** EC448_BIG_ENDIAN or EC448_LITTLE_ENDIAN to set which form to use.

See:

- [wc_curve448_init](#)
- [wc_curve448_make_key](#)
- [wc_curve448_shared_secret](#)

Return:

- 0 Returned on successfully computing a shared secret key.
- BAD_FUNC_ARG Returned if any of the input parameters passed in are NULL.

Example

```
int ret;

byte sharedKey[56];
word32 keySz;

curve448_key privKey, pubKey;
// initialize both keys

ret = wc_curve448_shared_secret_ex(&privKey, &pubKey, sharedKey, &keySz,
    EC448_BIG_ENDIAN);
if (ret != 0) {
    // error generating shared key
}
```

18.21.2.4 function wc_curve448_init

```
WOLFSSL_API int wc_curve448_init(
    curve448_key * key
)
```

This function initializes a Curve448 key. It should be called before generating a key for the structure.

Parameters:

- **key** Pointer to the curve448_key structure to initialize.

See: [wc_curve448_make_key](#)

Return:

- 0 Returned on successfully initializing the curve448_key structure.
- BAD_FUNC_ARG Returned when key is NULL.

Example

```
curve448_key key;
wc_curve448_init(&key); // initialize key
// make key and proceed to encryption
```

18.21.2.5 function `wc_curve448_free`

```
WOLFSSL_API void wc_curve448_free(
    curve448_key * key
)
```

This function frees a Curve448 object.

Parameters:

- **key** Pointer to the key object to free.

See:

- `wc_curve448_init`
- `wc_curve448_make_key`

Example

```
curve448_key privKey;
// initialize key, use it to generate shared secret key
wc_curve448_free(&privKey);
```

18.21.2.6 function `wc_curve448_import_private`

```
WOLFSSL_API int wc_curve448_import_private(
    const byte * priv,
    word32 privSz,
    curve448_key * key
)
```

This function imports a curve448 private key only. (Big endian).

Parameters:

- **priv** Pointer to a buffer containing the private key to import.
- **privSz** Length of the private key to import.
- **key** Pointer to the structure in which to store the imported key.

See:

- `wc_curve448_import_private_ex`
- `wc_curve448_size`

Return:

- 0 Returned on successfully importing private key.
- `BAD_FUNC_ARG` Returns if key or priv is null.
- `ECC_BAD_ARG_E` Returns if privSz is not equal to `CURVE448_KEY_SIZE`.

Example

```
int ret;

byte priv[] = { Contents of private key };
curve448_key key;
wc_curve448_init(&key);
```

```
ret = wc_curve448_import_private(priv, sizeof(priv), &key);
if (ret != 0) {
    // error importing key
}
```

18.21.2.7 function wc_curve448_import_private_ex

```
WOLFSSL_API int wc_curve448_import_private_ex(
    const byte * priv,
    word32 privSz,
    curve448_key * key,
    int endian
)
```

curve448 private key import only. (Big or Little endian).

Parameters:

- **priv** Pointer to a buffer containing the private key to import.
- **privSz** Length of the private key to import.
- **key** Pointer to the structure in which to store the imported key.
- **endian** EC448_BIG_ENDIAN or EC448_LITTLE_ENDIAN to set which form to use.

See:

- [wc_curve448_import_private](#)
- [wc_curve448_size](#)

Return:

- 0 Returned on successfully importing private key.
- BAD_FUNC_ARG Returns if key or priv is null.
- ECC_BAD_ARG_E Returns if privSz is not equal to CURVE448_KEY_SIZE.

Example

```
int ret;

byte priv[] = { // Contents of private key };
curve448_key key;
wc_curve448_init(&key);

ret = wc_curve448_import_private_ex(priv, sizeof(priv), &key,
    EC448_BIG_ENDIAN);
if (ret != 0) {
    // error importing key
}
```

18.21.2.8 function wc_curve448_import_private_raw

```
WOLFSSL_API int wc_curve448_import_private_raw(
    const byte * priv,
    word32 privSz,
    const byte * pub,
    word32 pubSz,
    curve448_key * key
)
```

This function imports a public-private key pair into a `curve448_key` structure. Big endian only.

Parameters:

- **priv** Pointer to a buffer containing the private key to import.
- **privSz** Length of the private key to import.
- **pub** Pointer to a buffer containing the public key to import.
- **pubSz** Length of the public key to import.
- **key** Pointer to the structure in which to store the imported keys

See:

- `wc_curve448_init`
- `wc_curve448_make_key`
- `wc_curve448_import_public`
- `wc_curve448_export_private_raw`

Return:

- 0 Returned on importing into the `curve448_key` structure.
- `BAD_FUNC_ARG` Returns if any of the input parameters are null.
- `ECC_BAD_ARG_E` Returned if the input key's key size does not match the public or private key sizes.

Example

```
int ret;

byte priv[56];
byte pub[56];
// initialize with public and private keys
curve448_key key;

wc_curve448_init(&key);
// initialize key

ret = wc_curve448_import_private_raw(&priv, sizeof(priv), pub, sizeof(pub),
                                     &key);
if (ret != 0) {
    // error importing keys
}
```

18.21.2.9 function `wc_curve448_import_private_raw_ex`

```
WOLFSSL_API int wc_curve448_import_private_raw_ex(
    const byte * priv,
    word32 privSz,
    const byte * pub,
    word32 pubSz,
    curve448_key * key,
    int endian
)
```

This function imports a public-private key pair into a `curve448_key` structure. Supports both big and little endian.

Parameters:

- **priv** Pointer to a buffer containing the private key to import.
- **privSz** Length of the private key to import.

- **pub** Pointer to a buffer containing the public key to import.
- **pubSz** Length of the public key to import.
- **key** Pointer to the structure in which to store the imported keys.
- **endian** EC448_BIG_ENDIAN or EC448_LITTLE_ENDIAN to set which form to use.

See:

- `wc_curve448_init`
- `wc_curve448_make_key`
- `wc_curve448_import_public`
- `wc_curve448_export_private_raw`
- `wc_curve448_import_private_raw`

Return:

- 0 Returned on importing into the `curve448_key` structure.
- `BAD_FUNC_ARG` Returns if any of the input parameters are null.
- `ECC_BAD_ARG_E` Returned if the input key's key size does not match the public or private key sizes.

Example

```
int ret;

byte priv[56];
byte pub[56];
// initialize with public and private keys
curve448_key key;

wc_curve448_init(&key);
// initialize key

ret = wc_curve448_import_private_raw_ex(&priv, sizeof(priv), pub,
                                       sizeof(pub), &key, EC448_BIG_ENDIAN);
if (ret != 0) {
    // error importing keys
}
```

18.21.2.10 function `wc_curve448_export_private_raw`

```
WOLFSSL_API int wc_curve448_export_private_raw(
    curve448_key * key,
    byte * out,
    word32 * outLen
)
```

This function exports a private key from a `curve448_key` structure and stores it in the given out buffer. It also sets `outLen` to be the size of the exported key. Big Endian only.

Parameters:

- **key** Pointer to the structure from which to export the key.
- **out** Pointer to the buffer in which to store the exported key.
- **outLen** On in, is the size of the out in bytes. On out, will store the bytes written to the output buffer.

See:

- `wc_curve448_init`
- `wc_curve448_make_key`

- `wc_curve448_import_private_raw`
- `wc_curve448_export_private_raw_ex`

Return:

- 0 Returned on successfully exporting the private key from the `curve448_key` structure.
- `BAD_FUNC_ARG` Returned if any input parameters are NULL.
- `ECC_BAD_ARG_E` Returned if `wc_curve448_size()` is not equal to key.

Example

```
int ret;
byte priv[56];
int privSz;

curve448_key key;
// initialize and make key

ret = wc_curve448_export_private_raw(&key, priv, &privSz);
if (ret != 0) {
    // error exporting key
}
```

18.21.2.11 function `wc_curve448_export_private_raw_ex`

```
WOLFSSL_API int wc_curve448_export_private_raw_ex(
    curve448_key * key,
    byte * out,
    word32 * outLen,
    int endian
)
```

This function exports a private key from a `curve448_key` structure and stores it in the given out buffer. It also sets `outLen` to be the size of the exported key. Can specify whether it's big or little endian.

Parameters:

- **key** Pointer to the structure from which to export the key.
- **out** Pointer to the buffer in which to store the exported key.
- **outLen** On in, is the size of the out in bytes. On out, will store the bytes written to the output buffer.
- **endian** `EC448_BIG_ENDIAN` or `EC448_LITTLE_ENDIAN` to set which form to use.

See:

- `wc_curve448_init`
- `wc_curve448_make_key`
- `wc_curve448_import_private_raw`
- `wc_curve448_export_private_raw`
- `wc_curve448_size`

Return:

- 0 Returned on successfully exporting the private key from the `curve448_key` structure.
- `BAD_FUNC_ARG` Returned if any input parameters are NULL.
- `ECC_BAD_ARG_E` Returned if `wc_curve448_size()` is not equal to key.

Example

```
int ret;
```

```

byte priv[56];
int privSz;
curve448_key key;
// initialize and make key
ret = wc_curve448_export_private_raw_ex(&key, priv, &privSz,
    EC448_BIG_ENDIAN);
if (ret != 0) {
    // error exporting key
}

```

18.21.2.12 function wc_curve448_import_public

```

WOLFSSL_API int wc_curve448_import_public(
    const byte * in,
    word32 inLen,
    curve448_key * key
)

```

This function imports a public key from the given in buffer and stores it in the curve448_key structure.

Parameters:

- **in** Pointer to the buffer containing the public key to import.
- **inLen** Length of the public key to import.
- **key** Pointer to the curve448_key structure in which to store the key.

See:

- [wc_curve448_init](#)
- [wc_curve448_export_public](#)
- [wc_curve448_import_private_raw](#)
- [wc_curve448_import_public_ex](#)
- [wc_curve448_check_public](#)
- [wc_curve448_size](#)

Return:

- 0 Returned on successfully importing the public key into the curve448_key structure.
- ECC_BAD_ARG_E Returned if the inLen parameter does not match the key size of the key structure.
- BAD_FUNC_ARG Returned if any of the input parameters are NULL.

Example

```

int ret;

byte pub[56];
// initialize pub with public key

curve448_key key;
// initialize key

ret = wc_curve448_import_public(pub, sizeof(pub), &key);
if (ret != 0) {
    // error importing key
}

```

18.21.2.13 function wc_curve448_import_public_ex

```
WOLFSSL_API int wc_curve448_import_public_ex(
    const byte * in,
    word32 inLen,
    curve448_key * key,
    int endian
)
```

This function imports a public key from the given in buffer and stores it in the curve448_key structure.

Parameters:

- **in** Pointer to the buffer containing the public key to import.
- **inLen** Length of the public key to import.
- **key** Pointer to the curve448_key structure in which to store the key.
- **endian** EC448_BIG_ENDIAN or EC448_LITTLE_ENDIAN to set which form to use.

See:

- [wc_curve448_init](#)
- [wc_curve448_export_public](#)
- [wc_curve448_import_private_raw](#)
- [wc_curve448_import_public](#)
- [wc_curve448_check_public](#)
- [wc_curve448_size](#)

Return:

- 0 Returned on successfully importing the public key into the curve448_key structure.
- ECC_BAD_ARG_E Returned if the inLen parameter does not match the key size of the key structure.
- BAD_FUNC_ARG Returned if any of the input parameters are NULL.

Example

```
int ret;

byte pub[56];
// initialize pub with public key
curve448_key key;
// initialize key

ret = wc_curve448_import_public_ex(pub, sizeof(pub), &key,
    EC448_BIG_ENDIAN);
if (ret != 0) {
    // error importing key
}
```

18.21.2.14 function wc_curve448_check_public

```
WOLFSSL_API int wc_curve448_check_public(
    const byte * pub,
    word32 pubSz,
    int endian
)
```

This function checks that a public key buffer holds a valid Curve448 key value given the endian ordering.

Parameters:

- **pub** Pointer to the buffer containing the public key to check.
- **pubLen** Length of the public key to check.
- **endian** EC448_BIG_ENDIAN or EC448_LITTLE_ENDIAN to set which form to use.

See:

- [wc_curve448_init](#)
- [wc_curve448_import_public](#)
- [wc_curve448_import_public_ex](#)
- [wc_curve448_size](#)

Return:

- 0 Returned when the public key value is valid.
- ECC_BAD_ARG_E Returned if the public key value is not valid.
- BAD_FUNC_ARG Returned if any of the input parameters are NULL.

Example

```
int ret;

byte pub[] = { Contents of public key };

ret = wc_curve448_check_public_ex(pub, sizeof(pub), EC448_BIG_ENDIAN);
if (ret != 0) {
    // error importing key
}
```

18.21.2.15 function `wc_curve448_export_public`

```
WOLFSSL_API int wc_curve448_export_public(
    curve448_key * key,
    byte * out,
    word32 * outLen
)
```

This function exports a public key from the given key structure and stores the result in the out buffer. Big endian only.

Parameters:

- **key** Pointer to the curve448_key structure in from which to export the key.
- **out** Pointer to the buffer in which to store the public key.
- **outLen** On in, is the size of the out in bytes. On out, will store the bytes written to the output buffer.

See:

- [wc_curve448_init](#)
- [wc_curve448_export_private_raw](#)
- [wc_curve448_import_public](#)

Return:

- 0 Returned on successfully exporting the public key from the curve448_key structure.
- ECC_BAD_ARG_E Returned if outLen is less than CURVE448_PUB_KEY_SIZE.
- BAD_FUNC_ARG Returned if any of the input parameters are NULL.

Example

```
int ret;
```

```

byte pub[56];
int pubSz;

curve448_key key;
// initialize and make key

ret = wc_curve448_export_public(&key, pub, &pubSz);
if (ret != 0) {
    // error exporting key
}

```

18.21.2.16 function `wc_curve448_export_public_ex`

```

WOLFSSL_API int wc_curve448_export_public_ex(
    curve448_key * key,
    byte * out,
    word32 * outLen,
    int endian
)

```

This function exports a public key from the given key structure and stores the result in the out buffer. Supports both big and little endian.

Parameters:

- **key** Pointer to the curve448_key structure in from which to export the key.
- **out** Pointer to the buffer in which to store the public key.
- **outLen** On in, is the size of the out in bytes. On out, will store the bytes written to the output buffer.
- **endian** EC448_BIG_ENDIAN or EC448_LITTLE_ENDIAN to set which form to use.

See:

- `wc_curve448_init`
- `wc_curve448_export_private_raw`
- `wc_curve448_import_public`

Return:

- 0 Returned on successfully exporting the public key from the curve448_key structure.
- ECC_BAD_ARG_E Returned if outLen is less than CURVE448_PUB_KEY_SIZE.
- BAD_FUNC_ARG Returned if any of the input parameters are NULL.

Example

```

int ret;

byte pub[56];
int pubSz;

curve448_key key;
// initialize and make key

ret = wc_curve448_export_public_ex(&key, pub, &pubSz, EC448_BIG_ENDIAN);
if (ret != 0) {
    // error exporting key
}

```

18.21.2.17 function `wc_curve448_export_key_raw`

```
WOLFSSL_API int wc_curve448_export_key_raw(
    curve448_key * key,
    byte * priv,
    word32 * privSz,
    byte * pub,
    word32 * pubSz
)
```

This function exports a key pair from the given key structure and stores the result in the out buffer. Big endian only.

Parameters:

- **key** Pointer to the `curve448_key` structure in from which to export the key pair.
- **priv** Pointer to the buffer in which to store the private key.
- **privSz** On in, is the size of the priv buffer in bytes. On out, will store the bytes written to the priv buffer.
- **pub** Pointer to the buffer in which to store the public key.
- **pubSz** On in, is the size of the pub buffer in bytes. On out, will store the bytes written to the pub buffer.

See:

- [wc_curve448_export_key_raw_ex](#)
- [wc_curve448_export_private_raw](#)

Return:

- 0 Returned on successfully exporting the key pair from the `curve448_key` structure.
- `BAD_FUNC_ARG` Returned if any input parameters are NULL.
- `ECC_BAD_ARG_E` Returned if `privSz` is less than `CURVE448_KEY_SIZE` or `pubSz` is less than `CURVE448_PUB_KEY_SIZE`.

Example

```
int ret;

byte pub[56];
byte priv[56];
int pubSz;
int privSz;

curve448_key key;
// initialize and make key

ret = wc_curve448_export_key_raw(&key, priv, &privSz, pub, &pubSz);
if (ret != 0) {
    // error exporting key
}
```

18.21.2.18 function `wc_curve448_export_key_raw_ex`

```
WOLFSSL_API int wc_curve448_export_key_raw_ex(
    curve448_key * key,
    byte * priv,
    word32 * privSz,
    byte * pub,
```

```

    word32 * pubSz,
    int endian
)

```

Export curve448 key pair. Big or little endian.

Parameters:

- **key** Pointer to the curve448_key structure in from which to export the key pair.
- **priv** Pointer to the buffer in which to store the private key.
- **privSz** On in, is the size of the priv buffer in bytes. On out, will store the bytes written to the priv buffer.
- **pub** Pointer to the buffer in which to store the public key.
- **pubSz** On in, is the size of the pub buffer in bytes. On out, will store the bytes written to the pub buffer.
- **endian** EC448_BIG_ENDIAN or EC448_LITTLE_ENDIAN to set which form to use.

See:

- [wc_curve448_export_key_raw](#)
- [wc_curve448_export_private_raw_ex](#)
- [wc_curve448_export_public_ex](#)

Return:

- 0 Success
- BAD_FUNC_ARG Returned if any input parameters are NULL.
- ECC_BAD_ARG_E Returned if privSz is less than CURVE448_KEY_SIZE or pubSz is less than CURVE448_PUB_KEY_SIZE.

This function exports a key pair from the given key structure and stores the result in the out buffer. Big or little endian.

Example

```

int ret;

byte pub[56];
byte priv[56];
int pubSz;
int privSz;

curve448_key key;
// initialize and make key

ret = wc_curve448_export_key_raw_ex(&key, priv, &privSz, pub, &pubSz,
    EC448_BIG_ENDIAN);
if (ret != 0) {
    // error exporting key
}

```

18.21.2.19 function wc_curve448_size

```

WOLFSSL_API int wc_curve448_size(
    curve448_key * key
)

```

This function returns the key size of the given key structure.

Parameters:

- **key** Pointer to the curve448_key structure in for which to determine the key size.

See:

- [wc_curve448_init](#)
- [wc_curve448_make_key](#)

Return:

- Success Given a valid, initialized curve448_key structure, returns the size of the key.
- 0 Returned if key is NULL.

Example

```
int keySz;

curve448_key key;
// initialize and make key

keySz = wc_curve448_size(&key);
```

18.22 Algorithms - DSA

18.22.1 Functions

	Name
WOLFSSL_API int	wc_InitDsaKey (DsaKey * key)This function initializes a DsaKey object in order to use it for authentication via the Digital Signature Algorithm (DSA).
WOLFSSL_API void	wc_FreeDsaKey (DsaKey * key)This function frees a DsaKey object after it has been used.
WOLFSSL_API int	wc_DsaSign (const byte * digest, byte * out, DsaKey * key, WC_RNG * rng)This function signs the digest with the private key.
WOLFSSL_API int	wc_DsaVerify (const byte * digest, const byte * sig, DsaKey * key, int * answer)This function verifies the signature.
WOLFSSL_API int	wc_DsaPublicKeyDecode (const byte * input, word32 * inOutIdx, DsaKey * , word32)This function decodes the public key.
WOLFSSL_API int	wc_DsaPrivateKeyDecode (const byte * input, word32 * inOutIdx, DsaKey * , word32)This function decodes the private key.
WOLFSSL_API int	wc_DsaKeyToDer (DsaKey * key, byte * output, word32 inLen)Convert DsaKey key to DER format.
WOLFSSL_API int	wc_MakeDsaKey (WC_RNG * rng, DsaKey * dsa)Create a DSA key.
WOLFSSL_API int	wc_MakeDsaParameters (WC_RNG * rng, int modulus_size, DsaKey * dsa)FIPS 186_4 defines valid parameters.

18.22.2 Functions Documentation

18.22.2.1 function wc_InitDsaKey

```
WOLFSSL_API int wc_InitDsaKey(
    DsaKey * key
)
```

This function initializes a DsaKey object in order to use it for authentication via the Digital Signature Algorithm (DSA).

Parameters:

- **key** pointer to the DsaKey structure to initialize

See: [wc_FreeDsaKey](#)

Return:

- 0 Returned on success.
- BAD_FUNC_ARG Returned if a NULL key is passed in.

Example

```
DsaKey key;
int ret;
ret = wc_InitDsaKey(&key); // initialize DSA key
```

18.22.2.2 function `wc_FreeDsaKey`

```
WOLFSSL_API void wc_FreeDsaKey(
    DsaKey * key
)
```

This function frees a DsaKey object after it has been used.

Parameters:

- **key** pointer to the DsaKey structure to free

See: `wc_FreeDsaKey`

Return: none No returns.

Example

```
DsaKey key;
// initialize key, use for authentication
...
wc_FreeDsaKey(&key); // free DSA key
```

18.22.2.3 function `wc_DsaSign`

```
WOLFSSL_API int wc_DsaSign(
    const byte * digest,
    byte * out,
    DsaKey * key,
    WC_RNG * rng
)
```

This function signs the input digest and stores the result in the output buffer, out.

Parameters:

- **digest** pointer to the hash to sign
- **out** pointer to the buffer in which to store the signature
- **key** pointer to the initialized DsaKey structure with which to generate the signature
- **rng** pointer to an initialized RNG to use with the signature generation

See: `wc_DsaVerify`

Return:

- 0 Returned on successfully signing the input digest
- MP_INIT_E may be returned if there is an error in processing the DSA signature.
- MP_READ_E may be returned if there is an error in processing the DSA signature.
- MP_CMP_E may be returned if there is an error in processing the DSA signature.
- MP_INVMOD_E may be returned if there is an error in processing the DSA signature.
- MP_EXPTMOD_E may be returned if there is an error in processing the DSA signature.
- MP_MOD_E may be returned if there is an error in processing the DSA signature.
- MP_MUL_E may be returned if there is an error in processing the DSA signature.
- MP_ADD_E may be returned if there is an error in processing the DSA signature.
- MP_MULMOD_E may be returned if there is an error in processing the DSA signature.
- MP_TO_E may be returned if there is an error in processing the DSA signature.
- MP_MEM may be returned if there is an error in processing the DSA signature.

Example

```
DsaKey key;
// initialize DSA key, load private Key
int ret;
WC_RNG rng;
wc_InitRng(&rng);
byte hash[] = { // initialize with hash digest };
byte signature[40]; // signature will be 40 bytes (320 bits)

ret = wc_DsaSign(hash, signature, &key, &rng);
if (ret != 0) {
    // error generating DSA signature
}
```

18.22.2.4 function wc_DsaVerify

```
WOLFSSL_API int wc_DsaVerify(
    const byte * digest,
    const byte * sig,
    DsaKey * key,
    int * answer
)
```

This function verifies the signature of a digest, given a private key. It stores whether the key properly verifies in the answer parameter, with 1 corresponding to a successful verification, and 0 corresponding to failed verification.

Parameters:

- **digest** pointer to the digest containing the subject of the signature
- **sig** pointer to the buffer containing the signature to verify
- **key** pointer to the initialized DsaKey structure with which to verify the signature
- **answer** pointer to an integer which will store whether the verification was successful

See: [wc_DsaSign](#)

Return:

- 0 Returned on successfully processing the verify request. Note: this does not mean that the signature is verified, only that the function succeeded
- MP_INIT_E may be returned if there is an error in processing the DSA signature.
- MP_READ_E may be returned if there is an error in processing the DSA signature.
- MP_CMP_E may be returned if there is an error in processing the DSA signature.
- MP_INVMOD_E may be returned if there is an error in processing the DSA signature.
- MP_EXPTMOD_E may be returned if there is an error in processing the DSA signature.
- MP_MOD_E may be returned if there is an error in processing the DSA signature.
- MP_MUL_E may be returned if there is an error in processing the DSA signature.
- MP_ADD_E may be returned if there is an error in processing the DSA signature.
- MP_MULMOD_E may be returned if there is an error in processing the DSA signature.
- MP_TO_E may be returned if there is an error in processing the DSA signature.
- MP_MEM may be returned if there is an error in processing the DSA signature.

Example

```
DsaKey key;
// initialize DSA key, load public Key

int ret;
```

```

int verified;
byte hash[] = { // initialize with hash digest };
byte signature[] = { // initialize with signature to verify };
ret = wc_DsaVerify(hash, signature, &key, &verified);
if (ret != 0) {
    // error processing verify request
} else if (answer == 0) {
    // invalid signature
}

```

18.22.2.5 function wc_DsaPublicKeyDecode

```

WOLFSSL_API int wc_DsaPublicKeyDecode(
    const byte * input,
    word32 * inOutIdx,
    DsaKey * ,
    word32
)

```

This function decodes a DER formatted certificate buffer containing a DSA public key, and stores the key in the given DsaKey structure. It also sets the inOutIdx parameter according to the length of the input read.

Parameters:

- **input** pointer to the buffer containing the DER formatted DSA public key
- **inOutIdx** pointer to an integer in which to store the final index of the certificate read
- **key** pointer to the DsaKey structure in which to store the public key
- **inSz** size of the input buffer

See:

- [wc_InitDsaKey](#)
- [wc_DsaPrivateKeyDecode](#)

Return:

- 0 Returned on successfully setting the public key for the DsaKey object
- ASN_PARSE_E Returned if there is an error in the encoding while reading the certificate buffer
- ASN_DH_KEY_E Returned if one of the DSA parameters is incorrectly formatted

Example

```

int ret, idx=0;

DsaKey key;
wc_InitDsaKey(&key);
byte derBuff[] = { // DSA public key};
ret = wc_DsaPublicKeyDecode(derBuff, &idx, &key, inSz);
if (ret != 0) {
    // error reading public key
}

```

18.22.2.6 function wc_DsaPrivateKeyDecode

```

WOLFSSL_API int wc_DsaPrivateKeyDecode(
    const byte * input,
    word32 * inOutIdx,
    DsaKey * ,

```

```

    word32
)

```

This function decodes a DER formatted certificate buffer containing a DSA private key, and stores the key in the given DsaKey structure. It also sets the inOutIdx parameter according to the length of the input read.

Parameters:

- **input** pointer to the buffer containing the DER formatted DSA private key
- **inOutIdx** pointer to an integer in which to store the final index of the certificate read
- **key** pointer to the DsaKey structure in which to store the private key
- **inSz** size of the input buffer

See:

- [wc_InitDsaKey](#)
- [wc_DsaPublicKeyDecode](#)

Return:

- 0 Returned on successfully setting the private key for the DsaKey object
- ASN_PARSE_E Returned if there is an error in the encoding while reading the certificate buffer
- ASN_DH_KEY_E Returned if one of the DSA parameters is incorrectly formatted

Example

```

int ret, idx=0;

DsaKey key;
wc_InitDsaKey(&key);
byte derBuff[] = { // DSA private key };
ret = wc_DsaPrivateKeyDecode(derBuff, &idx, &key, inSz);
if (ret != 0) {
    // error reading private key
}

```

18.22.2.7 function wc_DsaKeyToDer

```

WOLFSSL_API int wc_DsaKeyToDer(
    DsaKey * key,
    byte * output,
    word32 inLen
)

```

Convert DsaKey key to DER format, write to output (inLen), return bytes written.

Parameters:

- **key** Pointer to DsaKey structure to convert.
- **output** Pointer to output buffer for converted key.
- **inLen** Length of key input.

See:

- [wc_InitDsaKey](#)
- [wc_FreeDsaKey](#)
- [wc_MakeDsaKey](#)

Return:

- outLen Success, number of bytes written

- BAD_FUNC_ARG key or output are null or key->type is not DSA_PRIVATE.
- MEMORY_E Error allocating memory.

Example

```
DsaKey key;
WC_WC_RNG rng;
int derSz;
int bufferSize = // Sufficient buffer size;
byte der[bufferSize];

wc_InitDsaKey(&key);
wc_InitRng(&rng);
wc_MakeDsaKey(&rng, &key);
derSz = wc_DsaKeyToDer(&key, der, bufferSize);
```

18.22.2.8 function wc_MakeDsaKey

```
WOLFSSL_API int wc_MakeDsaKey(
    WC_RNG * rng,
    DsaKey * dsa
)
```

Create a DSA key.

Parameters:

- **rng** Pointer to WC_RNG structure.
- **dsa** Pointer to DsaKey structure.

See:

- [wc_InitDsaKey](#)
- [wc_FreeDsaKey](#)
- [wc_DsaSign](#)

Return:

- MP_OKAY Success
- BAD_FUNC_ARG Either rng or dsa is null.
- MEMORY_E Couldn't allocate memory for buffer.
- MP_INIT_E Error initializing mp_int

Example

```
WC_WC_RNG rng;
DsaKey dsa;
wc_InitRng(&rng);
wc_InitDsa(&dsa);
if(wc_MakeDsaKey(&rng, &dsa) != 0)
{
    // Error creating key
}
```

18.22.2.9 function wc_MakeDsaParameters

```
WOLFSSL_API int wc_MakeDsaParameters(
    WC_RNG * rng,
    int modulus_size,
    DsaKey * dsa
)
```

)

FIPS 186-4 defines valid for modulus_size values as (1024, 160) (2048, 256) (3072, 256)

Parameters:

- **rng** pointer to wolfCrypt rng.
- **modulus_size** 1024, 2048, or 3072 are valid values.
- **dsa** Pointer to a DsaKey structure.

See:

- [wc_MakeDsaKey](#)
- [wc_DsaKeyToDer](#)
- [wc_InitDsaKey](#)

Return:

- 0 Success
- BAD_FUNC_ARG rng or dsa is null or modulus_size is invalid.
- MEMORY_E Error attempting to allocate memory.

Example

```
DsaKey key;
WC_WC_RNG rng;
wc_InitDsaKey(&key);
wc_InitRng(&rng);
if(wc_MakeDsaParameters(&rng, 1024, &genKey) != 0)
{
    // Handle error
}
```

18.23.2 Functions Documentation

18.23.2.1 function wc_InitDhKey

```
WOLFSSL_API int wc_InitDhKey(
    DhKey * key
)
```

This function initializes a Diffie-Hellman key for use in negotiating a secure secret key with the Diffie-Hellman exchange protocol.

Parameters:

- **key** pointer to the DhKey structure to initialize for use with secure key exchanges

See:

- [wc_FreeDhKey](#)
- [wc_DhGenerateKeyPair](#)

Return: none No returns.

Example

```
DhKey key;
wc_InitDhKey(&key); // initialize DH key
```

18.23.2.2 function wc_FreeDhKey

```
WOLFSSL_API void wc_FreeDhKey(
    DhKey * key
)
```

This function frees a Diffie-Hellman key after it has been used to negotiate a secure secret key with the Diffie-Hellman exchange protocol.

Parameters:

- **key** pointer to the DhKey structure to free

See: [wc_InitDhKey](#)

Return: none No returns.

Example

```
DhKey key;
// initialize key, perform key exchange

wc_FreeDhKey(&key); // free DH key to avoid memory leaks
```

18.23.2.3 function wc_DhGenerateKeyPair

```
WOLFSSL_API int wc_DhGenerateKeyPair(
    DhKey * key,
    WC_RNG * rng,
    byte * priv,
    word32 * privSz,
```

```

    byte * pub,
    word32 * pubSz
)

```

This function generates a public/private key pair based on the Diffie-Hellman public parameters, storing the private key in `priv` and the public key in `pub`. It takes an initialized Diffie-Hellman key and an initialized `rng` structure.

Parameters:

- **key** pointer to the `DhKey` structure from which to generate the key pair
- **rng** pointer to an initialized random number generator (`rng`) with which to generate the keys
- **priv** pointer to a buffer in which to store the private key
- **privSz** will store the size of the private key written to `priv`
- **pub** pointer to a buffer in which to store the public key
- **pubSz** will store the size of the private key written to `pub`

See:

- [wc_InitDhKey](#)
- [wc_DhSetKey](#)
- [wc_DhKeyDecode](#)

Return:

- `BAD_FUNC_ARG` Returned if there is an error parsing one of the inputs to this function
- `RNG_FAILURE_E` Returned if there is an error generating a random number using `rng`
- `MP_INIT_E` May be returned if there is an error in the math library while generating the public key
- `MP_READ_E` May be returned if there is an error in the math library while generating the public key
- `MP_EXPTMOD_E` May be returned if there is an error in the math library while generating the public key
- `MP_TO_E` May be returned if there is an error in the math library while generating the public key

Example

```

DhKey key;
int ret;
byte priv[256];
byte pub[256];
word32 privSz, pubSz;

wc_InitDhKey(&key); // initialize key
// Set DH parameters using wc_DhSetKey or wc_DhKeyDecode
WC_RNG rng;
wc_InitRng(&rng); // initialize rng
ret = wc_DhGenerateKeyPair(&key, &rng, priv, &privSz, pub, &pubSz);

```

18.23.2.4 function `wc_DhAgree`

```

WOLFSSL_API int wc_DhAgree(
    DhKey * key,
    byte * agree,
    word32 * agreeSz,
    const byte * priv,
    word32 privSz,
    const byte * otherPub,
    word32 pubSz
)

```

)

This function generates an agreed upon secret key based on a local private key and a received public key. If completed on both sides of an exchange, this function generates an agreed upon secret key for symmetric communication. On successfully generating a shared secret key, the size of the secret key written will be stored in agreeSz.

Parameters:

- **key** pointer to the DhKey structure to use to compute the shared key
- **agree** pointer to the buffer in which to store the secret key
- **agreeSz** will hold the size of the secret key after successful generation
- **priv** pointer to the buffer containing the local secret key
- **privSz** size of the local secret key
- **otherPub** pointer to a buffer containing the received public key
- **pubSz** size of the received public key

See: [wc_DhGenerateKeyPair](#)

Return:

- 0 Returned on successfully generating an agreed upon secret key
- MP_INIT_E May be returned if there is an error while generating the shared secret key
- MP_READ_E May be returned if there is an error while generating the shared secret key
- MP_EXPTMOD_E May be returned if there is an error while generating the shared secret key
- MP_TO_E May be returned if there is an error while generating the shared secret key

Example

```
DhKey key;
int ret;
byte priv[256];
byte agree[256];
word32 agreeSz;

// initialize key, set key prime and base
// wc_DhGenerateKeyPair -- store private key in priv
byte pub[] = { // initialized with the received public key };
ret = wc_DhAgree(&key, agree, &agreeSz, priv, sizeof(priv), pub,
sizeof(pub));
if ( ret != 0 ) {
    // error generating shared key
}
```

18.23.2.5 function wc_DhKeyDecode

```
WOLFSSL_API int wc_DhKeyDecode(
    const byte * input,
    word32 * inOutIdx,
    DhKey * key,
    word32
)
```

This function decodes a Diffie-Hellman key from the given input buffer containing the key in DER format. It stores the result in the DhKey structure.

Parameters:

- **input** pointer to the buffer containing the DER formatted Diffie-Hellman key
- **inOutIdx** pointer to an integer in which to store the index parsed to while decoding the key

- **key** pointer to the DhKey structure to initialize with the input key
- **inSz** length of the input buffer. Gives the max length that may be read

See: [wc_DhSetKey](#)

Return:

- 0 Returned on successfully decoding the input key
- ASN_PARSE_E Returned if there is an error parsing the sequence of the input
- ASN_DH_KEY_E Returned if there is an error reading the private key parameters from the parsed input

Example

```
DhKey key;
word32 idx = 0;

byte keyBuff[1024];
// initialize with DER formatted key
wc_DhKeyInit(&key);
ret = wc_DhKeyDecode(keyBuff, &idx, &key, sizeof(keyBuff));

if ( ret != 0 ) {
    // error decoding key
}
```

18.23.2.6 function wc_DhSetKey

```
WOLFSSL_API int wc_DhSetKey(
    DhKey * key,
    const byte * p,
    word32 pSz,
    const byte * g,
    word32 gSz
)
```

This function sets the key for a DhKey structure using the input private key parameters. Unlike wc_DhKeyDecode, this function does not require that the input key be formatted in DER format, and instead simply accepts the parsed input parameters p (prime) and g (base).

Parameters:

- **key** pointer to the DhKey structure on which to set the key
- **p** pointer to the buffer containing the prime for use with the key
- **pSz** length of the input prime
- **g** pointer to the buffer containing the base for use with the key
- **gSz** length of the input base

See: [wc_DhKeyDecode](#)

Return:

- 0 Returned on successfully setting the key
- BAD_FUNC_ARG Returned if any of the input parameters evaluate to NULL
- MP_INIT_E Returned if there is an error initializing the key parameters for storage
- ASN_DH_KEY_E Returned if there is an error reading in the DH key parameters p and g

Example

```
DhKey key;
```

```

byte p[] = { // initialize with prime };
byte g[] = { // initialize with base };
wc_DhKeyInit(&key);
ret = wc_DhSetKey(key, p, sizeof(p), g, sizeof(g));

if ( ret != 0 ) {
    // error setting key
}

```

18.23.2.7 function wc_DhParamsLoad

```

WOLFSSL_API int wc_DhParamsLoad(
    const byte * input,
    word32 inSz,
    byte * p,
    word32 * pInOutSz,
    byte * g,
    word32 * gInOutSz
)

```

This function loads the Diffie-Hellman parameters, p (prime) and g (base) out of the given input buffer, DER formatted.

See:

- [wc_DhSetKey](#)
- [wc_DhKeyDecode](#)

Return:

- 0 Returned on successfully extracting the DH parameters
- ASN_PARSE_E Returned if an error occurs while parsing the DER formatted DH certificate
- BUFFER_E Returned if there is inadequate space in p or g to store the parsed parameters

\parma input pointer to a buffer containing a DER formatted Diffie-Hellman certificate to parse \parma inSz size of the input buffer \parma p pointer to a buffer in which to store the parsed prime \parma pInOutSz pointer to a word32 object containing the available size in the p buffer. Will be overwritten with the number of bytes written to the buffer after completing the function call \parma g pointer to a buffer in which to store the parsed base \parma gInOutSz pointer to a word32 object containing the available size in the g buffer. Will be overwritten with the number of bytes written to the buffer after completing the function call

Example

```

byte dhCert[] = { initialize with DER formatted certificate };
byte p[MAX_DH_SIZE];
byte g[MAX_DH_SIZE];
word32 pSz = MAX_DH_SIZE;
word32 gSz = MAX_DH_SIZE;

ret = wc_DhParamsLoad(dhCert, sizeof(dhCert), p, &pSz, g, &gSz);
if ( ret != 0 ) {
    // error parsing inputs
}

```

18.23.2.8 function wc_Dh_ffdhe2048_Get

```

WOLFSSL_API const DhParams * wc_Dh_ffdhe2048_Get(

```

```
    void  
)
```

This function returns ... and requires that HAVE_FFDHE_2048 be defined.

See:

- [wc_Dh_ffdhe3072_Get](#)
- [wc_Dh_ffdhe4096_Get](#)
- [wc_Dh_ffdhe6144_Get](#)
- [wc_Dh_ffdhe8192_Get](#)

18.23.2.9 function wc_Dh_ffdhe3072_Get

```
WOLFSSL_API const DhParams * wc_Dh_ffdhe3072_Get(  
    void  
)
```

This function returns ... and requires that HAVE_FFDHE_3072 be defined.

See:

- [wc_Dh_ffdhe2048_Get](#)
- [wc_Dh_ffdhe4096_Get](#)
- [wc_Dh_ffdhe6144_Get](#)
- [wc_Dh_ffdhe8192_Get](#)

18.23.2.10 function wc_Dh_ffdhe4096_Get

```
WOLFSSL_API const DhParams * wc_Dh_ffdhe4096_Get(  
    void  
)
```

This function returns ... and requires that HAVE_FFDHE_4096 be defined.

See:

- [wc_Dh_ffdhe2048_Get](#)
- [wc_Dh_ffdhe3072_Get](#)
- [wc_Dh_ffdhe6144_Get](#)
- [wc_Dh_ffdhe8192_Get](#)

18.23.2.11 function wc_Dh_ffdhe6144_Get

```
WOLFSSL_API const DhParams * wc_Dh_ffdhe6144_Get(  
    void  
)
```

This function returns ... and requires that HAVE_FFDHE_6144 be defined.

See:

- [wc_Dh_ffdhe2048_Get](#)
- [wc_Dh_ffdhe3072_Get](#)
- [wc_Dh_ffdhe4096_Get](#)
- [wc_Dh_ffdhe8192_Get](#)

18.23.2.12 function `wc_Dh_ffdhe8192_Get`

```
WOLFSSL_API const DhParams * wc_Dh_ffdhe8192_Get(  
    void  
)
```

This function returns ... and requires that HAVE_FFDHE_8192 be defined.

See:

- [wc_Dh_ffdhe2048_Get](#)
- [wc_Dh_ffdhe3072_Get](#)
- [wc_Dh_ffdhe4096_Get](#)
- [wc_Dh_ffdhe6144_Get](#)

18.23.2.13 function `wc_DhCheckKeyPair`

```
WOLFSSL_API int wc_DhCheckKeyPair(  
    DhKey * key,  
    const byte * pub,  
    word32 pubSz,  
    const byte * priv,  
    word32 privSz  
)
```

Checks DH keys for pair-wise consistency per process in SP 800-56Ar3, section 5.6.2.1.4, method (b) for FFC.

18.23.2.14 function `wc_DhCheckPrivKey`

```
WOLFSSL_API int wc_DhCheckPrivKey(  
    DhKey * key,  
    const byte * priv,  
    word32 pubSz  
)
```

Check DH private key for invalid numbers.

18.23.2.15 function `wc_DhCheckPrivKey_ex`

```
WOLFSSL_API int wc_DhCheckPrivKey_ex(  
    DhKey * key,  
    const byte * priv,  
    word32 pubSz,  
    const byte * prime,  
    word32 primeSz  
)
```

18.23.2.16 function `wc_DhCheckPubKey`

```
WOLFSSL_API int wc_DhCheckPubKey(  
    DhKey * key,  
    const byte * pub,  
    word32 pubSz  
)
```

18.23.2.17 function wc_DhCheckPubKey_ex

```
WOLFSSL_API int wc_DhCheckPubKey_ex(  
    DhKey * key,  
    const byte * pub,  
    word32 pubSz,  
    const byte * prime,  
    word32 primeSz  
)
```

18.23.2.18 function wc_DhExportParamsRaw

```
WOLFSSL_API int wc_DhExportParamsRaw(  
    DhKey * dh,  
    byte * p,  
    word32 * pSz,  
    byte * q,  
    word32 * qSz,  
    byte * g,  
    word32 * gSz  
)
```

18.23.2.19 function wc_DhGenerateParams

```
WOLFSSL_API int wc_DhGenerateParams(  
    WC_RNG * rng,  
    int modSz,  
    DhKey * dh  
)
```

18.23.2.20 function wc_DhSetCheckKey

```
WOLFSSL_API int wc_DhSetCheckKey(  
    DhKey * key,  
    const byte * p,  
    word32 pSz,  
    const byte * g,  
    word32 gSz,  
    const byte * q,  
    word32 qSz,  
    int trusted,  
    WC_RNG * rng  
)
```

18.23.2.21 function wc_DhSetKey_ex

```
WOLFSSL_API int wc_DhSetKey_ex(  
    DhKey * key,  
    const byte * p,  
    word32 pSz,  
    const byte * g,  
    word32 gSz,  
    const byte * q,  
    word32 qSz  
)
```

18.24 Algorithms - ECC

18.24.1 Functions

	Name
WOLFSSL_API int	wc_ecc_make_key (WC_RNG * rng, int keysize, ecc_key * key)This function generates a new ECC key.
WOLFSSL_API int	wc_ecc_make_key_ex (WC_RNG * rng, int keysize, ecc_key * key, int curve_id)This function generates a new ECC key with a specific curve.
WOLFSSL_API int	wc_ecc_check_key (ecc_key * key)Perform sanity checks on ecc key validity.
WOLFSSL_API void	wc_ecc_key_free (ecc_key * key)This function frees an ecc_key key after it has been used.
WOLFSSL_API int	wc_ecc_shared_secret (ecc_key * private_key, ecc_key * public_key, byte * out, word32 * outlen)Calculate the shared secret between two ECC keys.
WOLFSSL_API int	wc_ecc_shared_secret_ex (ecc_key * private_key, ecc_point * point, byte * out, word32 * outlen)Calculate the shared secret between an ECC key and a point.
WOLFSSL_API int	wc_ecc_sign_hash (const byte * in, word32 inlen, byte * out, word32 * outlen, WC_RNG * rng, ecc_key * key, mp_int * d)Sign a hash with an ECC key.
WOLFSSL_API int	wc_ecc_sign_hash_ex (const byte * in, word32 inlen, WC_RNG * rng, ecc_key * key, mp_int * d, byte * out, word32 * outlen)Sign a hash with an ECC key and a specific curve.
WOLFSSL_API int	wc_ecc_verify_hash (const byte * sig, word32 siglen, const byte * hash, word32 hashlen, ecc_key * key)Verify a hash signature with an ECC key.
WOLFSSL_API int	wc_ecc_init (ecc_key * key)This function initializes an ecc_key object for future use with a specific curve.
WOLFSSL_API int	wc_ecc_init_ex (ecc_key * key, void * heap, int devId)This function initializes an ecc_key object with a specific heap and device ID.
WOLFSSL_API ecc_key *	wc_ecc_key_new (void * heap)This function uses a user defined heap and allocates space for an ecc_key object.
WOLFSSL_API int	wc_ecc_free (ecc_key * key)This function frees an ecc_key object after it has been used.
WOLFSSL_API void	wc_ecc_fp_free (void)This function frees the fixed_point cache, which can be used with the fixed point arithmetic.
WOLFSSL_API int	wc_ecc_is_valid_idx (int n)Checks if an ECC idx is valid.
WOLFSSL_API ecc_point *	wc_ecc_new_point (void)Allocate a new ECC point.
WOLFSSL_API void	wc_ecc_del_point (ecc_point * p)Free an ECC point from memory.
WOLFSSL_API int	wc_ecc_copy_point (ecc_point * p, ecc_point * r)Copy the value of one point to another.
WOLFSSL_API int	wc_ecc_cmp_point (ecc_point * a, ecc_point * b)Compare the value of a point with another.
WOLFSSL_API int	wc_ecc_point_is_at_infinity (ecc_point * p)Checks if a point is at infinity. Returns 1 if point is at infinity, 0 otherwise.
WOLFSSL_API int	wc_ecc_mulmod (mp_int * k, ecc_point * G, ecc_point * R, mp_int * a, mp_int * modulus)Multiply a point by a scalar modulo the curve order.
WOLFSSL_API int	wc_ecc_export_x963 (ecc_key * key, byte * out, word32 * outLen)This function exports the ECC key in X9.63 format.
WOLFSSL_API int	wc_ecc_export_x963_ex (ecc_key * key, byte * out, word32 * outLen, int compressed)This function exports the ECC key in X9.63 format, optionally compressed.
WOLFSSL_API int	wc_ecc_import_x963 (const byte * in, word32 inLen, ecc_key * key)This function imports the ECC key in X9.63 format.
WOLFSSL_API int	wc_ecc_rs_to_sig (const char * r, const char * s, byte * out, word32 * outlen)This function converts the raw signature (r, s) to a DER format.
WOLFSSL_API int	wc_ecc_import_raw (ecc_key * key, const char * qx, const char * qy, const char * d, const char * curve_id)This function imports the ECC key in raw format.
WOLFSSL_API int	wc_ecc_export_private_only (ecc_key * key, byte * out, word32 * outLen)This function exports the private key only.
WOLFSSL_API int	wc_ecc_export_point_der (const int curve_idx, ecc_point * point, byte * out, word32 * outLen)This function exports the ECC point in DER format.
WOLFSSL_API int	wc_ecc_import_point_der (byte * in, word32 inLen, const int curve_idx, ecc_point * point)This function imports the ECC point in DER format.
WOLFSSL_API int	wc_ecc_size (ecc_key * key)This function returns the key size of an ecc_key structure in octets.
WOLFSSL_API int	wc_ecc_sig_size_calc (int sz)This function returns the worst case size for an ECC signature.
WOLFSSL_API int	wc_ecc_sig_size (ecc_key * key)This function returns the worst case size for an ECC signature.
WOLFSSL_API ecEncCtx *	wc_ecc_ctx_new (int flags, WC_RNG * rng)This function allocates and initializes space for an ECC context.
WOLFSSL_API void	wc_ecc_ctx_free (ecEncCtx * ctx)This function frees the ecEncCtx object used for encrypting/decrypting.
WOLFSSL_API int	wc_ecc_ctx_reset (ecEncCtx * ctx, WC_RNG * rng)This function resets an ecEncCtx structure to its initial state.
WOLFSSL_API const byte *	wc_ecc_ctx_get_own_salt (ecEncCtx * ctx)This function returns the salt of an ecEncCtx object.
WOLFSSL_API int	wc_ecc_ctx_set_peer_salt (ecEncCtx * ctx, const byte * salt)This function sets the peer salt for an ecEncCtx object.
WOLFSSL_API int	wc_ecc_ctx_set_info (ecEncCtx * ctx, const byte * info, int sz)This function can optionally be used to set additional information.
WOLFSSL_API int	wc_ecc_encrypt (ecc_key * privKey, ecc_key * pubKey, const byte * msg, word32 msgSz, ecEncCtx * ctx, byte * out, word32 * outLen)Encrypt a message with an ECC key.
WOLFSSL_API int	wc_ecc_decrypt (ecc_key * privKey, ecc_key * pubKey, const byte * msg, word32 msgSz, ecEncCtx * ctx, byte * out, word32 * outLen)Decrypt a message with an ECC key.
WOLFSSL_API int	wc_ecc_set_nonblock (ecc_key * key, ecc_nb_ctx_t * ctx)Enable ECC support for non-blocking operations.

18.24.2 Functions Documentation

18.24.2.1 function wc_ecc_make_key

```
WOLFSSL_API int wc_ecc_make_key(
    WC_RNG * rng,
    int keysize,
```

```
    ecc_key * key
)
```

This function generates a new ecc_key and stores it in key.

Parameters:

- **rng** pointer to an initialized RNG object with which to generate the key
- **keysize** desired length for the ecc_key
- **key** pointer to the ecc_key for which to generate a key

See:

- [wc_ecc_init](#)
- [wc_ecc_shared_secret](#)

Return:

- 0 Returned on success.
- ECC_BAD_ARG_E Returned if rng or key evaluate to NULL
- BAD_FUNC_ARG Returned if the specified key size is not in the correct range of supported keys
- MEMORY_E Returned if there is an error allocating memory while computing the ecc key
- MP_INIT_E may be returned if there is an error while computing the ecc key
- MP_READ_E may be returned if there is an error while computing the ecc key
- MP_CMP_E may be returned if there is an error while computing the ecc key
- MP_INVMOD_E may be returned if there is an error while computing the ecc key
- MP_EXPTMOD_E may be returned if there is an error while computing the ecc key
- MP_MOD_E may be returned if there is an error while computing the ecc key
- MP_MUL_E may be returned if there is an error while computing the ecc key
- MP_ADD_E may be returned if there is an error while computing the ecc key
- MP_MULMOD_E may be returned if there is an error while computing the ecc key
- MP_TO_E may be returned if there is an error while computing the ecc key
- MP_MEM may be returned if there is an error while computing the ecc key

Example

```
ecc_key key;
wc_ecc_init(&key);
WC_RNG rng;
wc_InitRng(&rng);
wc_ecc_make_key(&rng, 32, &key); // initialize 32 byte ecc key
```

18.24.2.2 function wc_ecc_make_key_ex

```
WOLFSSL_API int wc_ecc_make_key_ex(
    WC_RNG * rng,
    int keysizes,
    ecc_key * key,
    int curve_id
)
```

This function generates a new ecc_key and stores it in key.

Parameters:

- **key** Pointer to store the created key.
- **keysize** size of key to be created in bytes, set based on curveId
- **rng** Rng to be used in key creation
- **curve_id** Curve to use for key

See:

- `wc_ecc_make_key`
- `wc_ecc_get_curve_size_from_id`

Return:

- 0 Returned on success.
- `ECC_BAD_ARG_E` Returned if rng or key evaluate to NULL
- `BAD_FUNC_ARG` Returned if the specified key size is not in the correct range of supported keys
- `MEMORY_E` Returned if there is an error allocating memory while computing the ecc key
- `MP_INIT_E` may be returned if there is an error while computing the ecc key
- `MP_READ_E` may be returned if there is an error while computing the ecc key
- `MP_CMP_E` may be returned if there is an error while computing the ecc key
- `MP_INVMOD_E` may be returned if there is an error while computing the ecc key
- `MP_EXPTMOD_E` may be returned if there is an error while computing the ecc key
- `MP_MOD_E` may be returned if there is an error while computing the ecc key
- `MP_MUL_E` may be returned if there is an error while computing the ecc key
- `MP_ADD_E` may be returned if there is an error while computing the ecc key
- `MP_MULMOD_E` may be returned if there is an error while computing the ecc key
- `MP_TO_E` may be returned if there is an error while computing the ecc key
- `MP_MEM` may be returned if there is an error while computing the ecc key

Example

```
ecc_key key;
int ret;
WC_WC_RNG rng;
wc_ecc_init(&key);
wc_InitRng(&rng);
int curveId = ECC_SECP521R1;
int keySize = wc_ecc_get_curve_size_from_id(curveId);
ret = wc_ecc_make_key_ex(&rng, keySize, &key, curveId);
if (ret != MP_OKAY) {
    // error handling
}
```

18.24.2.3 function `wc_ecc_check_key`

```
WOLFSSL_API int wc_ecc_check_key(
    ecc_key * key
)
```

Perform sanity checks on ecc key validity.

Parameters:

- **key** Pointer to key to check.

See: `wc_ecc_point_is_at_infinity`

Return:

- `MP_OKAY` Success, key is OK.
- `BAD_FUNC_ARG` Returns if key is NULL.
- `ECC_INF_E` Returns if `wc_ecc_point_is_at_infinity` returns 1.

Example

```
ecc_key key;
WC_WC_RNG rng;
int check_result;
```

```

wc_ecc_init(&key);
wc_InitRng(&rng);
wc_ecc_make_key(&rng, 32, &key);
check_result = wc_ecc_check_key(&key);

if (check_result == MP_OKAY)
{
    // key check succeeded
}
else
{
    // key check failed
}

```

18.24.2.4 function `wc_ecc_key_free`

```

WOLFSSL_API void wc_ecc_key_free(
    ecc_key * key
)

```

This function frees an `ecc_key` key after it has been used.

Parameters:

- **key** pointer to the `ecc_key` structure to free

See:

- `wc_ecc_key_new`
- `wc_ecc_init_ex`

Example

```

// initialize key and perform ECC operations
...
wc_ecc_key_free(&key);

```

18.24.2.5 function `wc_ecc_shared_secret`

```

WOLFSSL_API int wc_ecc_shared_secret(
    ecc_key * private_key,
    ecc_key * public_key,
    byte * out,
    word32 * outlen
)

```

This function generates a new secret key using a local private key and a received public key. It stores this shared secret key in the buffer `out` and updates `outlen` to hold the number of bytes written to the output buffer.

Parameters:

- **private_key** pointer to the `ecc_key` structure containing the local private key
- **public_key** pointer to the `ecc_key` structure containing the received public key
- **out** pointer to an output buffer in which to store the generated shared secret key
- **outlen** pointer to the `word32` object containing the length of the output buffer. Will be overwritten with the length written to the output buffer upon successfully generating a shared secret key

See:

- `wc_ecc_init`
- `wc_ecc_make_key`

Return:

- 0 Returned upon successfully generating a shared secret key
- BAD_FUNC_ARG Returned if any of the input parameters evaluate to NULL
- ECC_BAD_ARG_E Returned if the type of the private key given as argument, `private_key`, is not ECC_PRIVATEKEY, or if the public and private key types (given by `ecc->dp`) are not equivalent
- MEMORY_E Returned if there is an error generating a new ecc point
- BUFFER_E Returned if the generated shared secret key is too long to store in the provided buffer
- MP_INIT_E may be returned if there is an error while computing the shared key
- MP_READ_E may be returned if there is an error while computing the shared key
- MP_CMP_E may be returned if there is an error while computing the shared key
- MP_INVMOD_E may be returned if there is an error while computing the shared key
- MP_EXPTMOD_E may be returned if there is an error while computing the shared key
- MP_MOD_E may be returned if there is an error while computing the shared key
- MP_MUL_E may be returned if there is an error while computing the shared key
- MP_ADD_E may be returned if there is an error while computing the shared key
- MP_MULMOD_E may be returned if there is an error while computing the shared key
- MP_TO_E may be returned if there is an error while computing the shared key
- MP_MEM may be returned if there is an error while computing the shared key

Example

```
ecc_key priv, pub;
WC_WC_RNG rng;
byte secret[1024]; // can hold 1024 byte shared secret key
word32 secretSz = sizeof(secret);
int ret;

wc_InitRng(&rng); // initialize rng
wc_ecc_init(&priv); // initialize key
wc_ecc_make_key(&rng, 32, &priv); // make public/private key pair
// receive public key, and initialise into pub
ret = wc_ecc_shared_secret(&priv, &pub, secret, &secretSz);
// generate secret key
if ( ret != 0 ) {
    // error generating shared secret key
}
```

18.24.2.6 function `wc_ecc_shared_secret_ex`

```
WOLFSSL_API int wc_ecc_shared_secret_ex(
    ecc_key * private_key,
    ecc_point * point,
    byte * out,
    word32 * outlen
)
```

Create an ECC shared secret between private key and public point.

Parameters:

- **private_key** The private ECC key.
- **point** The point to use (public key).
- **out** Output destination of the shared secret. Conforms to EC-DH from ANSI X9.63.
- **outlen** Input the max size and output the resulting size of the shared secret.

See: [wc_ecc_verify_hash_ex](#)

Return:

- MP_OKAY Indicates success.
- BAD_FUNC_ARG Error returned when any arguments are null.
- ECC_BAD_ARG_E Error returned if private_key->type is not ECC_PRIVATEKEY or private_key->idx fails to validate.
- BUFFER_E Error when outlen is too small.
- MEMORY_E Error to create a new point.
- MP_VAL possible when an initialization failure occurs.
- MP_MEM possible when an initialization failure occurs.

Example

```
ecc_key key;
ecc_point* point;
byte shared_secret[];
int secret_size;
int result;

point = wc_ecc_new_point();

result = wc_ecc_shared_secret_ex(&key, point,
&shared_secret, &secret_size);

if (result != MP_OKAY)
{
    // Handle error
}
```

18.24.2.7 function wc_ecc_sign_hash

```
WOLFSSL_API int wc_ecc_sign_hash(
    const byte * in,
    word32 inlen,
    byte * out,
    word32 * outlen,
    WC_RNG * rng,
    ecc_key * key
)
```

This function signs a message digest using an ecc_key object to guarantee authenticity.

Parameters:

- **in** pointer to the buffer containing the message hash to sign
- **inlen** length of the message hash to sign
- **out** buffer in which to store the generated signature
- **outlen** max length of the output buffer. Will store the bytes written to out upon successfully generating a message signature
- **key** pointer to a private ECC key with which to generate the signature

See: [wc_ecc_verify_hash](#)

Return:

- 0 Returned upon successfully generating a signature for the message digest

- **BAD_FUNC_ARG** Returned if any of the input parameters evaluate to NULL, or if the output buffer is too small to store the generated signature
- **ECC_BAD_ARG_E** Returned if the input key is not a private key, or if the ECC OID is invalid
- **RNG_FAILURE_E** Returned if the rng cannot successfully generate a satisfactory key
- **MP_INIT_E** may be returned if there is an error while computing the message signature
- **MP_READ_E** may be returned if there is an error while computing the message signature
- **MP_CMP_E** may be returned if there is an error while computing the message signature
- **MP_INVMOD_E** may be returned if there is an error while computing the message signature
- **MP_EXPTMOD_E** may be returned if there is an error while computing the message signature
- **MP_MOD_E** may be returned if there is an error while computing the message signature
- **MP_MUL_E** may be returned if there is an error while computing the message signature
- **MP_ADD_E** may be returned if there is an error while computing the message signature
- **MP_MULMOD_E** may be returned if there is an error while computing the message signature
- **MP_TO_E** may be returned if there is an error while computing the message signature
- **MP_MEM** may be returned if there is an error while computing the message signature

Example

```
ecc_key key;
WC_RNG rng;
int ret, sigSz;

byte sig[512]; // will hold generated signature
sigSz = sizeof(sig);
byte digest[] = { // initialize with message hash };
wc_InitRng(&rng); // initialize rng
wc_ecc_init(&key); // initialize key
wc_ecc_make_key(&rng, 32, &key); // make public/private key pair
ret = wc_ecc_sign_hash(digest, sizeof(digest), sig, &sigSz, &key);
if ( ret != 0 ) {
    // error generating message signature
}
```

18.24.2.8 function `wc_ecc_sign_hash_ex`

```
WOLFSSL_API int wc_ecc_sign_hash_ex(
    const byte * in,
    word32 inlen,
    WC_RNG * rng,
    ecc_key * key,
    mp_int * r,
    mp_int * s
)
```

Sign a message digest.

Parameters:

- **in** The message digest to sign.
- **inlen** The length of the digest.
- **rng** Pointer to WC_RNG struct.
- **key** A private ECC key.
- **r** The destination for r component of the signature.
- **s** The destination for s component of the signature.

See: [wc_ecc_verify_hash_ex](#)

Return:

- **MP_OKAY** Returned upon successfully generating a signature for the message digest
- **ECC_BAD_ARG_E** Returned if the input key is not a private key, or if the ECC IDX is invalid, or if any of the input parameters evaluate to NULL, or if the output buffer is too small to store the generated signature
- **RNG_FAILURE_E** Returned if the rng cannot successfully generate a satisfactory key
- **MP_INIT_E** may be returned if there is an error while computing the message signature
- **MP_READ_E** may be returned if there is an error while computing the message signature
- **MP_CMP_E** may be returned if there is an error while computing the message signature
- **MP_INVMOD_E** may be returned if there is an error while computing the message signature
- **MP_EXPTMOD_E** may be returned if there is an error while computing the message signature
- **MP_MOD_E** may be returned if there is an error while computing the message signature
- **MP_MUL_E** may be returned if there is an error while computing the message signature
- **MP_ADD_E** may be returned if there is an error while computing the message signature
- **MP_MULMOD_E** may be returned if there is an error while computing the message signature
- **MP_TO_E** may be returned if there is an error while computing the message signature
- **MP_MEM** may be returned if there is an error while computing the message signature

Example

```
ecc_key key;
WC_WC_WC_RNG rng;
int ret, sigSz;
mp_int r; // destination for r component of signature.
mp_int s; // destination for s component of signature.

byte sig[512]; // will hold generated signature
sigSz = sizeof(sig);
byte digest[] = { initialize with message hash };
wc_InitRng(&rng); // initialize rng
wc_ecc_init(&key); // initialize key
mp_init(&r); // initialize r component
mp_init(&s); // initialize s component
wc_ecc_make_key(&rng, 32, &key); // make public/private key pair
ret = wc_ecc_sign_hash_ex(digest, sizeof(digest), &rng, &key, &r, &s);

if ( ret != MP_OKAY ) {
    // error generating message signature
}
```

18.24.2.9 function **wc_ecc_verify_hash**

```
WOLFSSL_API int wc_ecc_verify_hash(
    const byte * sig,
    word32 siglen,
    const byte * hash,
    word32 hashlen,
    int * stat,
    ecc_key * key
)
```

This function verifies the ECC signature of a hash to ensure authenticity. It returns the answer through *stat*, with 1 corresponding to a valid signature, and 0 corresponding to an invalid signature.

Parameters:

- **sig** pointer to the buffer containing the signature to verify
- **siglen** length of the signature to verify

- **hash** pointer to the buffer containing the hash of the message verified
- **hashlen** length of the hash of the message verified
- **stat** pointer to the result of the verification. 1 indicates the message was successfully verified
- **key** pointer to a public ECC key with which to verify the signature

See:

- [wc_ecc_sign_hash](#)
- [wc_ecc_verify_hash_ex](#)

Return:

- 0 Returned upon successfully performing the signature verification. Note: This does not mean that the signature is verified. The authenticity information is stored instead in stat
- BAD_FUNC_ARG Returned any of the input parameters evaluate to NULL
- MEMORY_E Returned if there is an error allocating memory
- MP_INIT_E may be returned if there is an error while computing the message signature
- MP_READ_E may be returned if there is an error while computing the message signature
- MP_CMP_E may be returned if there is an error while computing the message signature
- MP_INVMOD_E may be returned if there is an error while computing the message signature
- MP_EXPTMOD_E may be returned if there is an error while computing the message signature
- MP_MOD_E may be returned if there is an error while computing the message signature
- MP_MUL_E may be returned if there is an error while computing the message signature
- MP_ADD_E may be returned if there is an error while computing the message signature
- MP_MULMOD_E may be returned if there is an error while computing the message signature
- MP_TO_E may be returned if there is an error while computing the message signature
- MP_MEM may be returned if there is an error while computing the message signature

Example

```
ecc_key key;
int ret, verified = 0;

byte sig[1024] { initialize with received signature };
byte digest[] = { initialize with message hash };
// initialize key with received public key
ret = wc_ecc_verify_hash(sig, sizeof(sig), digest, sizeof(digest),
&verified, &key);
if ( ret != 0 ) {
    // error performing verification
} else if ( verified == 0 ) {
    // the signature is invalid
}
```

18.24.2.10 function wc_ecc_init

```
WOLFSSL_API int wc_ecc_init(
    ecc_key * key
)
```

This function initializes an ecc_key object for future use with message verification or key negotiation.

Parameters:

- **key** pointer to the ecc_key object to initialize

See:

- [wc_ecc_make_key](#)
- [wc_ecc_free](#)

Return:

- 0 Returned upon successfully initializing the ecc_key object
- MEMORY_E Returned if there is an error allocating memory

Example

```
ecc_key key;  
wc_ecc_init(&key);
```

18.24.2.11 function wc_ecc_init_ex

```
WOLFSSL_API int wc_ecc_init_ex(  
    ecc_key * key,  
    void * heap,  
    int devId  
)
```

This function initializes an ecc_key object for future use with message verification or key negotiation.

Parameters:

- **key** pointer to the ecc_key object to initialize
- **devId** ID to use with async hardware
- **heap** pointer to a heap identifier

See:

- [wc_ecc_make_key](#)
- [wc_ecc_free](#)
- [wc_ecc_init](#)

Return:

- 0 Returned upon successfully initializing the ecc_key object
- MEMORY_E Returned if there is an error allocating memory

Example

```
ecc_key key;  
wc_ecc_init_ex(&key, heap, devId);
```

18.24.2.12 function wc_ecc_key_new

```
WOLFSSL_API ecc_key * wc_ecc_key_new(  
    void * heap  
)
```

This function uses a user defined heap and allocates space for the key structure.

See:

- [wc_ecc_make_key](#)
- [wc_ecc_key_free](#)
- [wc_ecc_init](#)

Return:

- 0 Returned upon successfully initializing the ecc_key object
- MEMORY_E Returned if there is an error allocating memory

Example

```
wc_ecc_key_new(&heap);
```

18.24.2.13 function `wc_ecc_free`

```
WOLFSSL_API int wc_ecc_free(  
    ecc_key * key  
)
```

This function frees an `ecc_key` object after it has been used.

Parameters:

- **key** pointer to the `ecc_key` object to free

See: `wc_ecc_init`

Return: int integer returned indicating wolfSSL error or success status.

Example

```
// initialize key and perform secure exchanges  
...  
wc_ecc_free(&key);
```

18.24.2.14 function `wc_ecc_fp_free`

```
WOLFSSL_API void wc_ecc_fp_free(  
    void  
)
```

This function frees the fixed-point cache, which can be used with ecc to speed up computation times. To use this functionality, `FP_ECC` (fixed-point ecc), should be defined.

Parameters:

- **none** No parameters.

See: `wc_ecc_free`

Return: none No returns.

Example

```
ecc_key key;  
// initialize key and perform secure exchanges  
...  
wc_ecc_fp_free();
```

18.24.2.15 function `wc_ecc_is_valid_idx`

```
WOLFSSL_API int wc_ecc_is_valid_idx(  
    int n  
)
```

Checks if an ECC idx is valid.

Parameters:

- **n** The idx number to check.

See: none

Return:

- 1 Return if valid.
- 0 Return if not valid.

Example

```
ecc_key key;
WC_WC_RNG rng;
int is_valid;
wc_ecc_init(&key);
wc_InitRng(&rng);
wc_ecc_make_key(&rng, 32, &key);
is_valid = wc_ecc_is_valid_idx(key.idx);
if (is_valid == 1)
{
    // idx is valid
}
else if (is_valid == 0)
{
    // idx is not valid
}
```

18.24.2.16 function `wc_ecc_new_point`

```
WOLFSSL_API ecc_point * wc_ecc_new_point(
    void
)
```

Allocate a new ECC point.

Parameters:

- **none** No parameters.

See:

- `wc_ecc_del_point`
- `wc_ecc_cmp_point`
- `wc_ecc_copy_point`

Return:

- p A newly allocated point.
- NULL Returns NULL on error.

Example

```
ecc_point* point;
point = wc_ecc_new_point();
if (point == NULL)
{
    // Handle point creation error
}
// Do stuff with point
```

18.24.2.17 function `wc_ecc_del_point`

```
WOLFSSL_API void wc_ecc_del_point(
    ecc_point * p
)
```

Free an ECC point from memory.

Parameters:

- **p** The point to free.

See:

- [wc_ecc_new_point](#)
- [wc_ecc_cmp_point](#)
- [wc_ecc_copy_point](#)

Return: none No returns.

Example

```
ecc_point* point;
point = wc_ecc_new_point();
if (point == NULL)
{
    // Handle point creation error
}
// Do stuff with point
wc_ecc_del_point(point);
```

18.24.2.18 function **wc_ecc_copy_point**

```
WOLFSSL_API int wc_ecc_copy_point(
    ecc_point * p,
    ecc_point * r
)
```

Copy the value of one point to another one.

Parameters:

- **p** The point to copy.
- **r** The created point.

See:

- [wc_ecc_new_point](#)
- [wc_ecc_cmp_point](#)
- [wc_ecc_del_point](#)

Return:

- ECC_BAD_ARG_E Error thrown when p or r is null.
- MP_OKAY Point copied successfully
- ret Error from internal functions. Can be...

Example

```
ecc_point* point;
ecc_point* copied_point;
int copy_return;

point = wc_ecc_new_point();
copy_return = wc_ecc_copy_point(point, copied_point);
if (copy_return != MP_OKAY)
{
    // Handle error
}
```

18.24.2.19 function `wc_ecc_cmp_point`

```
WOLFSSL_API int wc_ecc_cmp_point(  
    ecc_point * a,  
    ecc_point * b  
)
```

Compare the value of a point with another one.

Parameters:

- **a** First point to compare.
- **b** Second point to compare.

See:

- `wc_ecc_new_point`
- `wc_ecc_del_point`
- `wc_ecc_copy_point`

Return:

- `BAD_FUNC_ARG` One or both arguments are NULL.
- `MP_EQ` The points are equal.
- `ret` Either `MP_LT` or `MP_GT` and signifies that the points are not equal.

Example

```
ecc_point* point;  
ecc_point* point_to_compare;  
int cmp_result;  
  
point = wc_ecc_new_point();  
point_to_compare = wc_ecc_new_point();  
cmp_result = wc_ecc_cmp_point(point, point_to_compare);  
if (cmp_result == BAD_FUNC_ARG)  
{  
    // arguments are invalid  
}  
else if (cmp_result == MP_EQ)  
{  
    // Points are equal  
}  
else  
{  
    // Points are not equal  
}
```

18.24.2.20 function `wc_ecc_point_is_at_infinity`

```
WOLFSSL_API int wc_ecc_point_is_at_infinity(  
    ecc_point * p  
)
```

Checks if a point is at infinity. Returns 1 if point is at infinity, 0 if not, < 0 on error.

Parameters:

- **p** The point to check.

See:

- `wc_ecc_new_point`
- `wc_ecc_del_point`
- `wc_ecc_cmp_point`
- `wc_ecc_copy_point`

Return:

- 1 p is at infinity.
- 0 p is not at infinity.
- <0 Error.

Example

```
ecc_point* point;
int is_infinity;
point = wc_ecc_new_point();

is_infinity = wc_ecc_point_is_at_infinity(point);
if (is_infinity < 0)
{
    // Handle error
}
else if (is_infinity == 0)
{
    // Point is not at infinity
}
else if (is_infinity == 1)
{
    // Point is at infinity
}
```

18.24.2.21 function `wc_ecc_mulmod`

```
WOLFSSL_API int wc_ecc_mulmod(
    mp_int * k,
    ecc_point * G,
    ecc_point * R,
    mp_int * a,
    mp_int * modulus,
    int map
)
```

Perform ECC Fixed Point multiplication.

Parameters:

- **k** The multiplicand.
- **G** Base point to multiply.
- **R** Destination of product.
- **modulus** The modulus for the curve.
- **map** If non-zero maps the point back to affine coordinates, otherwise it's left in jacobian-montgomery form.

See: none

Return:

- `MP_OKAY` Returns on successful operation.

- **MP_INIT_E** Returned if there is an error initializing an integer for use with the multiple precision integer (mp_int) library.

Example

```
ecc_point* base;
ecc_point* destination;
// Initialize points
base = wc_ecc_new_point();
destination = wc_ecc_new_point();
// Setup other arguments
mp_int multiplicand;
mp_int modulus;
int map;
```

18.24.2.22 function wc_ecc_export_x963

```
WOLFSSL_API int wc_ecc_export_x963(
    ecc_key * ,
    byte * out,
    word32 * outLen
)
```

This function exports the ECC key from the ecc_key structure, storing the result in out. The key will be stored in ANSI X9.63 format. It stores the bytes written to the output buffer in outLen.

Parameters:

- **key** pointer to the ecc_key object to export
- **out** pointer to the buffer in which to store the ANSI X9.63 formatted key
- **outLen** size of the output buffer. On successfully storing the key, will hold the bytes written to the output buffer

See:

- [wc_ecc_export_x963_ex](#)
- [wc_ecc_import_x963](#)

Return:

- 0 Returned on successfully exporting the ecc_key
- **LENGTH_ONLY_E** Returned if the output buffer evaluates to NULL, but the other two input parameters are valid. Indicates that the function is only returning the length required to store the key
- **ECC_BAD_ARG_E** Returned if any of the input parameters are NULL, or the key is unsupported (has an invalid index)
- **BUFFER_E** Returned if the output buffer is too small to store the ecc key. If the output buffer is too small, the size needed will be returned in outLen
- **MEMORY_E** Returned if there is an error allocating memory with XMALLOC
- **MP_INIT_E** may be returned if there is an error processing the ecc_key
- **MP_READ_E** may be returned if there is an error processing the ecc_key
- **MP_CMP_E** may be returned if there is an error processing the ecc_key
- **MP_INVMOD_E** may be returned if there is an error processing the ecc_key
- **MP_EXPTMOD_E** may be returned if there is an error processing the ecc_key
- **MP_MOD_E** may be returned if there is an error processing the ecc_key
- **MP_MUL_E** may be returned if there is an error processing the ecc_key
- **MP_ADD_E** may be returned if there is an error processing the ecc_key
- **MP_MULMOD_E** may be returned if there is an error processing the ecc_key
- **MP_TO_E** may be returned if there is an error processing the ecc_key

- MP_MEM may be returned if there is an error processing the ecc_key

Example

```
int ret;
byte buff[1024];
word32 buffSz = sizeof(buff);

ecc_key key;
// initialize key, make key
ret = wc_ecc_export_x963(&key, buff, &buffSz);
if ( ret != 0 ) {
    // error exporting key
}
```

18.24.2.23 function wc_ecc_export_x963_ex

```
WOLFSSL_API int wc_ecc_export_x963_ex(
    ecc_key * ,
    byte * out,
    word32 * outLen,
    int compressed
)
```

This function exports the ECC key from the ecc_key structure, storing the result in out. The key will be stored in ANSI X9.63 format. It stores the bytes written to the output buffer in outLen. This function allows the additional option of compressing the certificate through the compressed parameter. When this parameter is true, the key will be stored in ANSI X9.63 compressed format.

Parameters:

- **key** pointer to the ecc_key object to export
- **out** pointer to the buffer in which to store the ANSI X9.63 formatted key
- **outLen** size of the output buffer. On successfully storing the key, will hold the bytes written to the output buffer
- **compressed** indicator of whether to store the key in compressed format. 1==compressed, 0==uncompressed

See:

- [wc_ecc_export_x963](#)
- [wc_ecc_import_x963](#)

Return:

- 0 Returned on successfully exporting the ecc_key
- NOT_COMPILED_IN Returned if the HAVE_COMP_KEY was not enabled at compile time, but the key was requested in compressed format
- LENGTH_ONLY_E Returned if the output buffer evaluates to NULL, but the other two input parameters are valid. Indicates that the function is only returning the length required to store the key
- ECC_BAD_ARG_E Returned if any of the input parameters are NULL, or the key is unsupported (has an invalid index)
- BUFFER_E Returned if the output buffer is too small to store the ecc key. If the output buffer is too small, the size needed will be returned in outLen
- MEMORY_E Returned if there is an error allocating memory with XMALLOC
- MP_INIT_E may be returned if there is an error processing the ecc_key
- MP_READ_E may be returned if there is an error processing the ecc_key
- MP_CMP_E may be returned if there is an error processing the ecc_key

- MP_INVMOD_E may be returned if there is an error processing the ecc_key
- MP_EXPTMOD_E may be returned if there is an error processing the ecc_key
- MP_MOD_E may be returned if there is an error processing the ecc_key
- MP_MUL_E may be returned if there is an error processing the ecc_key
- MP_ADD_E may be returned if there is an error processing the ecc_key
- MP_MULMOD_E may be returned if there is an error processing the ecc_key
- MP_TO_E may be returned if there is an error processing the ecc_key
- MP_MEM may be returned if there is an error processing the ecc_key

Example

```
int ret;
byte buff[1024];
word32 buffSz = sizeof(buff);
ecc_key key;
// initialize key, make key
ret = wc_ecc_export_x963_ex(&key, buff, &buffSz, 1);
if ( ret != 0 ) {
    // error exporting key
}
```

18.24.2.24 function wc_ecc_import_x963

```
WOLFSSL_API int wc_ecc_import_x963(
    const byte * in,
    word32 inLen,
    ecc_key * key
)
```

This function imports a public ECC key from a buffer containing the key stored in ANSI X9.63 format. This function will handle both compressed and uncompressed keys, as long as compressed keys are enabled at compile time through the HAVE_COMP_KEY option.

Parameters:

- **in** pointer to the buffer containing the ANSI x9.63 formatted ECC key
- **inLen** length of the input buffer
- **key** pointer to the ecc_key object in which to store the imported key

See:

- [wc_ecc_export_x963](#)
- [wc_ecc_import_private_key](#)

Return:

- 0 Returned on successfully importing the ecc_key
- NOT_COMPILED_IN Returned if the HAVE_COMP_KEY was not enabled at compile time, but the key is stored in compressed format
- ECC_BAD_ARG_E Returned if in or key evaluate to NULL, or the inLen is even (according to the x9.63 standard, the key must be odd)
- MEMORY_E Returned if there is an error allocating memory
- ASN_PARSE_E Returned if there is an error parsing the ECC key; may indicate that the ECC key is not stored in valid ANSI X9.63 format
- IS_POINT_E Returned if the public key exported is not a point on the ECC curve
- MP_INIT_E may be returned if there is an error processing the ecc_key
- MP_READ_E may be returned if there is an error processing the ecc_key
- MP_CMP_E may be returned if there is an error processing the ecc_key
- MP_INVMOD_E may be returned if there is an error processing the ecc_key

- MP_EXPTMOD_E may be returned if there is an error processing the ecc_key
- MP_MOD_E may be returned if there is an error processing the ecc_key
- MP_MUL_E may be returned if there is an error processing the ecc_key
- MP_ADD_E may be returned if there is an error processing the ecc_key
- MP_MULMOD_E may be returned if there is an error processing the ecc_key
- MP_TO_E may be returned if there is an error processing the ecc_key
- MP_MEM may be returned if there is an error processing the ecc_key

Example

```
int ret;
byte buff[] = { initialize with ANSI X9.63 formatted key };

ecc_key pubKey;
wc_ecc_init(&pubKey);

ret = wc_ecc_import_x963(buff, sizeof(buff), &pubKey);
if ( ret != 0 ) {
    // error importing key
}
```

18.24.2.25 function wc_ecc_rs_to_sig

```
WOLFSSL_API int wc_ecc_rs_to_sig(
    const char * r,
    const char * s,
    byte * out,
    word32 * outlen
)
```

This function converts the R and S portions of an ECC signature into a DER-encoded ECDSA signature. This function also stores the length written to the output buffer, out, in outlen.

Parameters:

- **r** pointer to the buffer containing the R portion of the signature as a string
- **s** pointer to the buffer containing the S portion of the signature as a string
- **out** pointer to the buffer in which to store the DER-encoded ECDSA signature
- **outlen** length of the output buffer available. Will store the bytes written to the buffer after successfully converting the signature to ECDSA format

See:

- [wc_ecc_sign_hash](#)
- [wc_ecc_sig_size](#)

Return:

- 0 Returned on successfully converting the signature
- ECC_BAD_ARG_E Returned if any of the input parameters evaluate to NULL, or if the input buffer is not large enough to hold the DER-encoded ECDSA signature
- MP_INIT_E may be returned if there is an error processing the ecc_key
- MP_READ_E may be returned if there is an error processing the ecc_key
- MP_CMP_E may be returned if there is an error processing the ecc_key
- MP_INVMOD_E may be returned if there is an error processing the ecc_key
- MP_EXPTMOD_E may be returned if there is an error processing the ecc_key
- MP_MOD_E may be returned if there is an error processing the ecc_key
- MP_MUL_E may be returned if there is an error processing the ecc_key
- MP_ADD_E may be returned if there is an error processing the ecc_key

- MP_MULMOD_E may be returned if there is an error processing the ecc_key
- MP_TO_E may be returned if there is an error processing the ecc_key
- MP_MEM may be returned if there is an error processing the ecc_key

Example

```
int ret;
ecc_key key;
// initialize key, generate R and S

char r[] = { initialize with R };
char s[] = { initialize with S };
byte sig[wc_ecc_sig_size(key)];
// signature size will be 2 * ECC key size + ~10 bytes for ASN.1 overhead
word32 sigSz = sizeof(sig);
ret = wc_ecc_rs_to_sig(r, s, sig, &sigSz);
if ( ret != 0 ) {
    // error converting parameters to signature
}
```

18.24.2.26 function wc_ecc_import_raw

```
WOLFSSL_API int wc_ecc_import_raw(
    ecc_key * key,
    const char * qx,
    const char * qy,
    const char * d,
    const char * curveName
)
```

This function fills an ecc_key structure with the raw components of an ECC signature.

Parameters:

- **key** pointer to an ecc_key structure to fill
- **qx** pointer to a buffer containing the x component of the base point as an ASCII hex string
- **qy** pointer to a buffer containing the y component of the base point as an ASCII hex string
- **d** pointer to a buffer containing the private key as an ASCII hex string
- **curveName** pointer to a string containing the ECC curve name, as found in ecc_sets

See: [wc_ecc_import_private_key](#)

Return:

- 0 Returned upon successfully importing into the ecc_key structure
- ECC_BAD_ARG_E Returned if any of the input values evaluate to NULL
- MEMORY_E Returned if there is an error initializing space to store the parameters of the ecc_key
- ASN_PARSE_E Returned if the input curveName is not defined in ecc_sets
- MP_INIT_E may be returned if there is an error processing the input parameters
- MP_READ_E may be returned if there is an error processing the input parameters
- MP_CMP_E may be returned if there is an error processing the input parameters
- MP_INVMOD_E may be returned if there is an error processing the input parameters
- MP_EXPTMOD_E may be returned if there is an error processing the input parameters
- MP_MOD_E may be returned if there is an error processing the input parameters
- MP_MUL_E may be returned if there is an error processing the input parameters
- MP_ADD_E may be returned if there is an error processing the input parameters
- MP_MULMOD_E may be returned if there is an error processing the input parameters
- MP_TO_E may be returned if there is an error processing the input parameters

- MP_MEM may be returned if there is an error processing the input parameters

Example

```
int ret;
ecc_key key;
wc_ecc_init(&key);

char qx[] = { initialize with x component of base point };
char qy[] = { initialize with y component of base point };
char d[] = { initialize with private key };
ret = wc_ecc_import_raw(&key, qx, qy, d, "ECC-256");
if ( ret != 0 ) {
    // error initializing key with given inputs
}
```

18.24.2.27 function wc_ecc_export_private_only

```
WOLFSSL_API int wc_ecc_export_private_only(
    ecc_key * key,
    byte * out,
    word32 * outLen
)
```

This function exports only the private key from an ecc_key structure. It stores the private key in the buffer out, and sets the bytes written to this buffer in outLen.

Parameters:

- **key** pointer to an ecc_key structure from which to export the private key
- **out** pointer to the buffer in which to store the private key
- **outLen** pointer to a word32 object with the size available in out. Set with the number of bytes written to out after successfully exporting the private key

See: [wc_ecc_import_private_key](#)

Return:

- 0 Returned upon successfully exporting the private key
- ECC_BAD_ARG_E Returned if any of the input values evaluate to NULL
- MEMORY_E Returned if there is an error initializing space to store the parameters of the ecc_key
- ASN_PARSE_E Returned if the input curveName is not defined in ecc_sets
- MP_INIT_E may be returned if there is an error processing the input parameters
- MP_READ_E may be returned if there is an error processing the input parameters
- MP_CMP_E may be returned if there is an error processing the input parameters
- MP_INVMOD_E may be returned if there is an error processing the input parameters
- MP_EXPTMOD_E may be returned if there is an error processing the input parameters
- MP_MOD_E may be returned if there is an error processing the input parameters
- MP_MUL_E may be returned if there is an error processing the input parameters
- MP_ADD_E may be returned if there is an error processing the input parameters
- MP_MULMOD_E may be returned if there is an error processing the input parameters
- MP_TO_E may be returned if there is an error processing the input parameters
- MP_MEM may be returned if there is an error processing the input parameters

Example

```
int ret;
ecc_key key;
// initialize key, make key
```

```

char priv[ECC_KEY_SIZE];
word32 privSz = sizeof(priv);
ret = wc_ecc_export_private_only(&key, priv, &privSz);
if ( ret != 0) {
    // error exporting private key
}

```

18.24.2.28 function wc_ecc_export_point_der

```

WOLFSSL_API int wc_ecc_export_point_der(
    const int curve_idx,
    ecc_point * point,
    byte * out,
    word32 * outLen
)

```

Export point to der.

Parameters:

- **curve_idx** Index of the curve used from ecc_sets.
- **point** Point to export to der.
- **out** Destination for the output.
- **outLen** Maxsize allowed for output, destination for final size of output

See: [wc_ecc_import_point_der](#)

Return:

- 0 Returned on success.
- ECC_BAD_ARG_E Returns if curve_idx is less than 0 or invalid. Also returns when
- LENGTH_ONLY_E outLen is set but nothing else.
- BUFFER_E Returns if outLen is less than 1 + 2 * the curve size.
- MEMORY_E Returns if there is a problem allocating memory.

Example

```

int curve_idx;
ecc_point* point;
byte out[];
word32 outLen;
wc_ecc_export_point_der(curve_idx, point, out, &outLen);

```

18.24.2.29 function wc_ecc_import_point_der

```

WOLFSSL_API int wc_ecc_import_point_der(
    byte * in,
    word32 inLen,
    const int curve_idx,
    ecc_point * point
)

```

Import point from der format.

Parameters:

- **in** der buffer to import point from.
- **inLen** Length of der buffer.
- **curve_idx** Index of curve.

- **point** Destination for point.

See: [wc_ecc_export_point_der](#)

Return:

- ECC_BAD_ARG_E Returns if any arguments are null or if inLen is even.
- MEMORY_E Returns if there is an error initializing
- NOT_COMPILED_IN Returned if HAVE_COMP_KEY is not true and in is a compressed cert
- MP_OKAY Successful operation.

Example

```
byte in[];
word32 inLen;
int curve_idx;
ecc_point* point;
wc_ecc_import_point_der(in, inLen, curve_idx, point);
```

18.24.2.30 function wc_ecc_size

```
WOLFSSL_API int wc_ecc_size(
    ecc_key * key
)
```

This function returns the key size of an ecc_key structure in octets.

Parameters:

- **key** pointer to an ecc_key structure for which to get the key size

See: [wc_ecc_make_key](#)

Return:

- Given a valid key, returns the key size in octets
- 0 Returned if the given key is NULL

Example

```
int keySz;
ecc_key key;
// initialize key, make key
keySz = wc_ecc_size(&key);
if ( keySz == 0) {
    // error determining key size
}
```

18.24.2.31 function wc_ecc_sig_size_calc

```
WOLFSSL_API int wc_ecc_sig_size_calc(
    int sz
)
```

This function returns the worst case size for an ECC signature, given by: (keySz * 2) + SIG_HEADER_SZ + ECC_MAX_PAD_SZ. The actual signature size can be computed with wc_ecc_sign_hash.

Parameters:

- **key** size

See:

- `wc_ecc_sign_hash`
- `wc_ecc_sig_size`

Return: returns the maximum signature size, in octets

Example

```
int sigSz = wc_ecc_sig_size_calc(32);
if ( sigSz == 0) {
    // error determining sig size
}
```

18.24.2.32 function `wc_ecc_sig_size`

```
WOLFSSL_API int wc_ecc_sig_size(
    ecc_key * key
)
```

This function returns the worst case size for an ECC signature, given by: $(keySz * 2) + SIG_HEADER_SZ + ECC_MAX_PAD_SZ$. The actual signature size can be computed with `wc_ecc_sign_hash`.

Parameters:

- **key** pointer to an `ecc_key` structure for which to get the signature size

See:

- `wc_ecc_sign_hash`
- `wc_ecc_sig_size_calc`

Return:

- Success Given a valid key, returns the maximum signature size, in octets
- 0 Returned if the given key is NULL

Example

```
int sigSz;
ecc_key key;
// initialize key, make key

sigSz = wc_ecc_sig_size(&key);
if ( sigSz == 0) {
    // error determining sig size
}
```

18.24.2.33 function `wc_ecc_ctx_new`

```
WOLFSSL_API ecEncCtx * wc_ecc_ctx_new(
    int flags,
    WC_RNG * rng
)
```

This function allocates and initializes space for a new ECC context object to allow secure message exchange with ECC.

Parameters:

- **flags** indicate whether this is a server or client context Options are: `REQ_RESP_CLIENT`, and `REQ_RESP_SERVER`
- **rng** pointer to a RNG object with which to generate a salt

See:

- [wc_ecc_encrypt](#)
- [wc_ecc_decrypt](#)

Return:

- Success On successfully generating a new ecEncCtx object, returns a pointer to that object
- NULL Returned if the function fails to generate a new ecEncCtx object

Example

```
ecEncCtx* ctx;
WC_WC_RNG rng;
wc_InitRng(&rng);
ctx = wc_ecc_ctx_new(REQ_RESP_CLIENT, &rng);
if(ctx == NULL) {
    // error generating new ecEncCtx object
}
```

18.24.2.34 function wc_ecc_ctx_free

```
WOLFSSL_API void wc_ecc_ctx_free(
    ecEncCtx *
```

)

This function frees the ecEncCtx object used for encrypting and decrypting messages.

Parameters:

- **ctx** pointer to the ecEncCtx object to free

See: [wc_ecc_ctx_new](#)

Return: none Returns.

Example

```
ecEncCtx* ctx;
WC_WC_RNG rng;
wc_InitRng(&rng);
ctx = wc_ecc_ctx_new(REQ_RESP_CLIENT, &rng);
// do secure communication
...
wc_ecc_ctx_free(&ctx);
```

18.24.2.35 function wc_ecc_ctx_reset

```
WOLFSSL_API int wc_ecc_ctx_reset(
    ecEncCtx * ,
    WC_RNG *
```

)

This function resets an ecEncCtx structure to avoid having to free and allocate a new context object.

Parameters:

- **ctx** pointer to the ecEncCtx object to reset
- **rng** pointer to an RNG object with which to generate a new salt

See: [wc_ecc_ctx_new](#)

Return:

- 0 Returned if the ecEncCtx structure is successfully reset
- BAD_FUNC_ARG Returned if either rng or ctx is NULL
- RNG_FAILURE_E Returned if there is an error generating a new salt for the ECC object

Example

```
ecEncCtx* ctx;
WC_WC_RNG rng;
wc_InitRng(&rng);
ctx = wc_ecc_ctx_new(REQ_RESP_CLIENT, &rng);
// do secure communication
...
wc_ecc_ctx_reset(&ctx, &rng);
// do more secure communication
```

18.24.2.36 function wc_ecc_ctx_get_own_salt

```
WOLFSSL_API const byte * wc_ecc_ctx_get_own_salt(
    ecEncCtx *
```

This function returns the salt of an ecEncCtx object. This function should only be called when the ecEncCtx's state is ecSRV_INIT or ecCLI_INIT.

Parameters:

- **ctx** pointer to the ecEncCtx object from which to get the salt

See:

- [wc_ecc_ctx_new](#)
- [wc_ecc_ctx_set_peer_salt](#)

Return:

- Success On success, returns the ecEncCtx salt
- NULL Returned if the ecEncCtx object is NULL, or the ecEncCtx's state is not ecSRV_INIT or ecCLI_INIT. In the latter two cases, this function also sets the ecEncCtx's state to ecSRV_BAD_STATE or ecCLI_BAD_STATE, respectively

Example

```
ecEncCtx* ctx;
WC_WC_RNG rng;
const byte* salt;
wc_InitRng(&rng);
ctx = wc_ecc_ctx_new(REQ_RESP_CLIENT, &rng);
salt = wc_ecc_ctx_get_own_salt(&ctx);
if(salt == NULL) {
    // error getting salt
}
```

18.24.2.37 function wc_ecc_ctx_set_peer_salt

```
WOLFSSL_API int wc_ecc_ctx_set_peer_salt(
    ecEncCtx * ,
    const byte * salt
)
```

This function sets the peer salt of an ecEncCtx object.

Parameters:

- **ctx** pointer to the ecEncCtx for which to set the salt
- **salt** pointer to the peer's salt

See: [wc_ecc_ctx_get_own_salt](#)

Return:

- 0 Returned upon successfully setting the peer salt for the ecEncCtx object.
- BAD_FUNC_ARG Returned if the given ecEncCtx object is NULL or has an invalid protocol, or if the given salt is NULL
- BAD_ENC_STATE_E Returned if the ecEncCtx's state is ecSRV_SALT_GET or ecCLI_SALT_GET. In the latter two cases, this function also sets the ecEncCtx's state to ecSRV_BAD_STATE or ecCLI_BAD_STATE, respectively

Example

```
ecEncCtx* cliCtx, srvCtx;
WC_WC_RNG rng;
const byte* cliSalt, srvSalt;
int ret;

wc_InitRng(&rng);
cliCtx = wc_ecc_ctx_new(REQ_RESP_CLIENT, &rng);
srvCtx = wc_ecc_ctx_new(REQ_RESP_SERVER, &rng);

cliSalt = wc_ecc_ctx_get_own_salt(&cliCtx);
srvSalt = wc_ecc_ctx_get_own_salt(&srvCtx);
ret = wc_ecc_ctx_set_peer_salt(&cliCtx, srvSalt);
```

18.24.2.38 function wc_ecc_ctx_set_info

```
WOLFSSL_API int wc_ecc_ctx_set_info(
    ecEncCtx *,
    const byte * info,
    int sz
)
```

This function can optionally be called before or after wc_ecc_ctx_set_peer_salt. It sets optional information for an ecEncCtx object.

Parameters:

- **ctx** pointer to the ecEncCtx for which to set the info
- **info** pointer to a buffer containing the info to set
- **sz** size of the info buffer

See: [wc_ecc_ctx_new](#)

Return:

- 0 Returned upon successfully setting the information for the ecEncCtx object.
- BAD_FUNC_ARG Returned if the given ecEncCtx object is NULL, the input info is NULL or it's size is invalid

Example

```
ecEncCtx* ctx;
byte info[] = { initialize with information };
```

```
// initialize ctx, get salt,
if(wc_ecc_ctx_set_info(&ctx, info, sizeof(info))) {
    // error setting info
}
```

18.24.2.39 function wc_ecc_encrypt

```
WOLFSSL_API int wc_ecc_encrypt(
    ecc_key * privKey,
    ecc_key * pubKey,
    const byte * msg,
    word32 msgSz,
    byte * out,
    word32 * outSz,
    ecEncCtx * ctx
)
```

This function encrypts the given input message from msg to out. This function takes an optional ctx object as parameter. When supplied, encryption proceeds based on the ecEncCtx's encAlgo, kdfAlgo, and macAlgo. If ctx is not supplied, processing completes with the default algorithms, ecAES_128_CBC, ecHKDF_SHA256 and ecHMAC_SHA256. This function requires that the messages are padded according to the encryption type specified by ctx.

Parameters:

- **privKey** pointer to the ecc_key object containing the private key to use for encryption
- **pubKey** pointer to the ecc_key object containing the public key of the peer with whom one wishes to communicate
- **msg** pointer to the buffer holding the message to encrypt
- **msgSz** size of the buffer to encrypt
- **out** pointer to the buffer in which to store the encrypted ciphertext
- **outSz** pointer to a word32 object containing the available size in the out buffer. Upon successfully encrypting the message, holds the number of bytes written to the output buffer
- **ctx** Optional: pointer to an ecEncCtx object specifying different encryption algorithms to use

See: [wc_ecc_decrypt](#)

Return:

- 0 Returned upon successfully encrypting the input message
- BAD_FUNC_ARG Returned if privKey, pubKey, msg, msgSz, out, or outSz are NULL, or the ctx object specifies an unsupported encryption type
- BAD_ENC_STATE_E Returned if the ctx object given is in a state that is not appropriate for encryption
- BUFFER_E Returned if the supplied output buffer is too small to store the encrypted ciphertext
- MEMORY_E Returned if there is an error allocating memory for the shared secret key

Example

```
byte msg[] = { initialize with msg to encrypt. Ensure padded to block size };
byte out[sizeof(msg)];
word32 outSz = sizeof(out);
int ret;
ecc_key cli, serv;
// initialize cli with private key
// initialize serv with received public key

ecEncCtx* cliCtx, servCtx;
```

```
// initialize cliCtx and servCtx
// exchange salts
ret = wc_ecc_encrypt(&cli, &serv, msg, sizeof(msg), out, &outSz, cliCtx);
if(ret != 0) {
    // error encrypting message
}
```

18.24.2.40 function wc_ecc_decrypt

```
WOLFSSL_API int wc_ecc_decrypt(
    ecc_key * privKey,
    ecc_key * pubKey,
    const byte * msg,
    word32 msgSz,
    byte * out,
    word32 * outSz,
    ecEncCtx * ctx
)
```

This function decrypts the ciphertext from msg to out. This function takes an optional ctx object as parameter. When supplied, encryption proceeds based on the ecEncCtx's encAlgo, kdfAlgo, and macAlgo. If ctx is not supplied, processing completes with the default algorithms, ecAES_128_CBC, ecHKDF_SHA256 and ecHMAC_SHA256. This function requires that the messages are padded according to the encryption type specified by ctx.

Parameters:

- **privKey** pointer to the ecc_key object containing the private key to use for decryption
- **pubKey** pointer to the ecc_key object containing the public key of the peer with whom one wishes to communicate
- **msg** pointer to the buffer holding the ciphertext to decrypt
- **msgSz** size of the buffer to decrypt
- **out** pointer to the buffer in which to store the decrypted plaintext
- **outSz** pointer to a word32 object containing the available size in the out buffer. Upon successfully decrypting the ciphertext, holds the number of bytes written to the output buffer
- **ctx** Optional: pointer to an ecEncCtx object specifying different decryption algorithms to use

See: [wc_ecc_encrypt](#)

Return:

- 0 Returned upon successfully decrypting the input message
- BAD_FUNC_ARG Returned if privKey, pubKey, msg, msgSz, out, or outSz are NULL, or the ctx object specifies an unsupported encryption type
- BAD_ENC_STATE_E Returned if the ctx object given is in a state that is not appropriate for decryption
- BUFFER_E Returned if the supplied output buffer is too small to store the decrypted plaintext
- MEMORY_E Returned if there is an error allocating memory for the shared secret key

Example

```
byte cipher[] = { initialize with
ciphertext to decrypt. Ensure padded to block size };
byte plain[sizeof(cipher)];
word32 plainSz = sizeof(plain);
int ret;
ecc_key cli, serv;
// initialize cli with private key
```

```

// initialize serv with received public key
ecEncCtx* cliCtx, servCtx;
// initialize cliCtx and servCtx
// exchange salts
ret = wc_ecc_decrypt(&cli, &serv, cipher, sizeof(cipher),
plain, &plainSz, cliCtx);

if(ret != 0) {
    // error decrypting message
}

```

18.24.2.41 function wc_ecc_set_nonblock

```

WOLFSSL_API int wc_ecc_set_nonblock(
    ecc_key * key,
    ecc_nb_ctx_t * ctx
)

```

Enable ECC support for non-blocking operations. Supported for Single Precision (SP) math with the following build options: WOLFSSL_SP_NONBLOCK WOLFSSL_SP_SMALL WOLFSSL_SP_NO_MALLOC WC_ECC_NONBLOCK.

Parameters:

- **key** pointer to the ecc_key object
- **ctx** pointer to ecc_nb_ctx_t structure with stack data cache for SP

Return: 0 Returned upon successfully setting the callback context the input message

Example

```

int ret;
ecc_key ecc;
ecc_nb_ctx_t nb_ctx;

ret = wc_ecc_init(&ecc);
if (ret == 0) {
    ret = wc_ecc_set_nonblock(&ecc, &nb_ctx);
    if (ret == 0) {
        do {
            ret = wc_ecc_verify_hash_ex(
                &r, &s, // r/s as mp_int
                hash, hashSz, // computed hash digest
                &verify_res, // verification result 1=success
                &key
            );

            // TODO: Real-time work can be called here
        } while (ret == FP_WOULDBLOCK);
    }
    wc_ecc_free(&key);
}

```

18.25.2 Functions Documentation

18.25.2.1 function wc_ed25519_make_public

```
WOLFSSL_API int wc_ed25519_make_public(
    ed25519_key * key,
    unsigned char * pubKey,
    word32 pubKeySz
)
```

This function generates the Ed25519 public key from the private key. It stores the public key in the buffer pubKey, and sets the bytes written to this buffer in pubKeySz.

Parameters:

- **key** Pointer to the ed25519_key for which to generate a key.
- **out** Pointer to the buffer in which to store the public key.
- **outLen** Pointer to a word32 object with the size available in out. Set with the number of bytes written to out after successfully exporting the public key.

See:

- [wc_ed25519_init](#)
- [wc_ed25519_import_private_only](#)
- [wc_ed25519_make_key](#)

Return:

- 0 Returned upon successfully making the public key.
- BAD_FUNC_ARG Returned if key or pubKey evaluate to NULL, or if the specified key size is not 32 bytes (Ed25519 has 32 byte keys).

- MEMORY_E Returned if there is an error allocating memory during function execution.

Example

```
int ret;

ed25519_key key;
byte priv[] = { initialize with 32 byte private key };
byte pub[32];
word32 pubSz = sizeof(pub);

wc_ed25519_init(&key);
wc_ed25519_import_private_only(priv, sizeof(priv), &key);
ret = wc_ed25519_make_public(&key, pub, &pubSz);
if (ret != 0) {
    // error making public key
}
```

18.25.2.2 function wc_ed25519_make_key

```
WOLFSSL_API int wc_ed25519_make_key(
    WC_RNG * rng,
    int keysz,
    ed25519_key * key
)
```

This function generates a new Ed25519 key and stores it in key.

Parameters:

- **rng** Pointer to an initialized RNG object with which to generate the key.
- **keysize** Length of key to generate. Should always be 32 for Ed25519.
- **key** Pointer to the ed25519_key for which to generate a key.

See: [wc_ed25519_init](#)

Return:

- 0 Returned upon successfully making an ed25519_key.
- BAD_FUNC_ARG Returned if rng or key evaluate to NULL, or if the specified key size is not 32 bytes (Ed25519 has 32 byte keys).
- MEMORY_E Returned if there is an error allocating memory during function execution.

Example

```
int ret;

WC_RNG rng;
ed25519_key key;

wc_InitRng(&rng);
wc_ed25519_init(&key);
wc_ed25519_make_key(&rng, 32, &key);
if (ret != 0) {
    // error making key
}
```

18.25.2.3 function wc_ed25519_sign_msg

```
WOLFSSL_API int wc_ed25519_sign_msg(
    const byte * in,
    word32 inlen,
    byte * out,
    word32 * outlen,
    ed25519_key * key
)
```

This function signs a message using an ed25519_key object to guarantee authenticity.

Parameters:

- **in** Pointer to the buffer containing the message to sign.
- **inlen** Length of the message to sign.
- **out** Buffer in which to store the generated signature.
- **outlen** Maximum length of the output buffer. Will store the bytes written to out upon successfully generating a message signature.
- **key** Pointer to a private ed25519_key with which to generate the signature.

See:

- [wc_ed25519ctx_sign_msg](#)
- [wc_ed25519ph_sign_hash](#)
- [wc_ed25519ph_sign_msg](#)
- [wc_ed25519_verify_msg](#)

Return:

- 0 Returned upon successfully generating a signature for the message.
- BAD_FUNC_ARG Returned if any of the input parameters evaluate to NULL, or if the output buffer is too small to store the generated signature.
- MEMORY_E Returned if there is an error allocating memory during function execution.

Example

```
ed25519_key key;
WC_RNG rng;
int ret, sigSz;

byte sig[64]; // will hold generated signature
sigSz = sizeof(sig);
byte message[] = { initialize with message };

wc_InitRng(&rng); // initialize rng
wc_ed25519_init(&key); // initialize key
wc_ed25519_make_key(&rng, 32, &key); // make public/private key pair
ret = wc_ed25519_sign_msg(message, sizeof(message), sig, &sigSz, &key);
if (ret != 0) {
    // error generating message signature
}
```

18.25.2.4 function wc_ed25519ctx_sign_msg

```
WOLFSSL_API int wc_ed25519ctx_sign_msg(
    const byte * in,
    word32 inlen,
    byte * out,
    word32 * outlen,
    ed25519_key * key,
```

```

    const byte * context,
    byte contextLen
)

```

This function signs a message using an `ed25519_key` object to guarantee authenticity. The context is part of the data signed.

Parameters:

- **in** Pointer to the buffer containing the message to sign.
- **inlen** Length of the message to sign.
- **out** Buffer in which to store the generated signature.
- **outlen** Maximum length of the output buffer. Will store the bytes written to out upon successfully generating a message signature.
- **key** Pointer to a private `ed25519_key` with which to generate the signature.
- **context** Pointer to the buffer containing the context for which message is being signed.
- **contextLen** Length of the context buffer.

See:

- `wc_ed25519_sign_msg`
- `wc_ed25519ph_sign_hash`
- `wc_ed25519ph_sign_msg`
- `wc_ed25519_verify_msg`

Return:

- 0 Returned upon successfully generating a signature for the message.
- `BAD_FUNC_ARG` Returned any of the input parameters evaluate to NULL, or if the output buffer is too small to store the generated signature.
- `MEMORY_E` Returned if there is an error allocating memory during function execution.

Example

```

ed25519_key key;
WC_RNG rng;
int ret, sigSz;

byte sig[64]; // will hold generated signature
sigSz = sizeof(sig);
byte message[] = { initialize with message };
byte context[] = { initialize with context of signing };

wc_InitRng(&rng); // initialize rng
wc_ed25519_init(&key); // initialize key
wc_ed25519_make_key(&rng, 32, &key); // make public/private key pair
ret = wc_ed25519ctx_sign_msg(message, sizeof(message), sig, &sigSz, &key,
    context, sizeof(context));
if (ret != 0) {
    // error generating message signature
}

```

18.25.2.5 function `wc_ed25519ph_sign_hash`

```

WOLFSSL_API int wc_ed25519ph_sign_hash(
    const byte * hash,
    word32 hashLen,
    byte * out,
    word32 * outLen,

```

```

    ed25519_key * key,
    const byte * context,
    byte contextLen
)

```

This function signs a message digest using an `ed25519_key` object to guarantee authenticity. The context is included as part of the data signed. The message is pre-hashed before signature calculation. The hash algorithm used to create message digest must be SHAKE-256.

Parameters:

- **hash** Pointer to the buffer containing the hash of the message to sign.
- **hashLen** Length of the hash of the message to sign.
- **out** Buffer in which to store the generated signature.
- **outlen** Maximum length of the output buffer. Will store the bytes written to out upon successfully generating a message signature.
- **key** Pointer to a private `ed25519_key` with which to generate the signature.
- **context** Pointer to the buffer containing the context for which message is being signed.
- **contextLen** Length of the context buffer.

See:

- `wc_ed25519_sign_msg`
- `wc_ed25519ctx_sign_msg`
- `wc_ed25519ph_sign_msg`
- `wc_ed25519_verify_msg`

Return:

- 0 Returned upon successfully generating a signature for the message digest.
- `BAD_FUNC_ARG` Returned any of the input parameters evaluate to NULL, or if the output buffer is too small to store the generated signature.
- `MEMORY_E` Returned if there is an error allocating memory during function execution.

Example

```

ed25519_key key;
WC_RNG rng;
int ret, sigSz;

byte sig[64]; // will hold generated signature
sigSz = sizeof(sig);
byte hash[] = { initialize with SHA-512 hash of message };
byte context[] = { initialize with context of signing };

wc_InitRng(&rng); // initialize rng
wc_ed25519_init(&key); // initialize key
wc_ed25519_make_key(&rng, 32, &key); // make public/private key pair
ret = wc_ed25519ph_sign_hash(hash, sizeof(hash), sig, &sigSz, &key,
    context, sizeof(context));
if (ret != 0) {
    // error generating message signature
}

```

18.25.2.6 function `wc_ed25519ph_sign_msg`

```

WOLFSSL_API int wc_ed25519ph_sign_msg(
    const byte * in,
    word32 inlen,

```

```

    byte * out,
    word32 * outlen,
    ed25519_key * key,
    const byte * context,
    byte contextLen
)

```

This function signs a message using an `ed25519_key` object to guarantee authenticity. The context is included as part of the data signed. The message is pre-hashed before signature calculation.

Parameters:

- **in** Pointer to the buffer containing the message to sign.
- **inlen** Length of the message to sign.
- **out** Buffer in which to store the generated signature.
- **outlen** Maximum length of the output buffer. Will store the bytes written to out upon successfully generating a message signature.
- **key** Pointer to a private `ed25519_key` with which to generate the signature.
- **context** Pointer to the buffer containing the context for which message is being signed.
- **contextLen** Length of the context buffer.

See:

- `wc_ed25519_sign_msg`
- `wc_ed25519ctx_sign_msg`
- `wc_ed25519ph_sign_hash`
- `wc_ed25519_verify_msg`

Return:

- 0 Returned upon successfully generating a signature for the message.
- `BAD_FUNC_ARG` Returned any of the input parameters evaluate to NULL, or if the output buffer is too small to store the generated signature.
- `MEMORY_E` Returned if there is an error allocating memory during function execution.

Example

```

ed25519_key key;
WC_RNG rng;
int ret, sigSz;

byte sig[64]; // will hold generated signature
sigSz = sizeof(sig);
byte message[] = { initialize with message };
byte context[] = { initialize with context of signing };

wc_InitRng(&rng); // initialize rng
wc_ed25519_init(&key); // initialize key
wc_ed25519_make_key(&rng, 32, &key); // make public/private key pair
ret = wc_ed25519ph_sign_msg(message, sizeof(message), sig, &sigSz, &key,
    context, sizeof(context));
if (ret != 0) {
    // error generating message signature
}

```

18.25.2.7 function `wc_ed25519_verify_msg`

```

WOLFSSL_API int wc_ed25519_verify_msg(
    const byte * sig,

```

```

    word32 siglen,
    const byte * msg,
    word32 msgLen,
    int * ret,
    ed25519_key * key
)

```

This function verifies the Ed25519 signature of a message to ensure authenticity. It returns the answer through `res`, with 1 corresponding to a valid signature, and 0 corresponding to an invalid signature.

Parameters:

- **sig** Pointer to the buffer containing the signature to verify.
- **siglen** Length of the signature to verify.
- **msg** Pointer to the buffer containing the message to verify.
- **msgLen** Length of the message to verify.
- **res** Pointer to the result of the verification. 1 indicates the message was successfully verified.
- **key** Pointer to a public Ed25519 key with which to verify the signature.

See:

- [wc_ed25519ctx_verify_msg](#)
- [wc_ed25519ph_verify_hash](#)
- [wc_ed25519ph_verify_msg](#)
- [wc_ed25519_sign_msg](#)

Return:

- 0 Returned upon successfully performing the signature verification and authentication.
- BAD_FUNC_ARG Returned if any of the input parameters evaluate to NULL, or if the `siglen` does not match the actual length of a signature.
- SIG_VERIFY_E Returned if verification completes, but the signature generated does not match the signature provided.

Example

```

ed25519_key key;
int ret, verified = 0;

byte sig[] { initialize with received signature };
byte msg[] = { initialize with message };
// initialize key with received public key
ret = wc_ed25519_verify_msg(sig, sizeof(sig), msg, sizeof(msg), &verified,
    &key);
if (ret < 0) {
    // error performing verification
} else if (verified == 0)
    // the signature is invalid
}

```

18.25.2.8 function wc_ed25519ctx_verify_msg

```

WOLFSSL_API int wc_ed25519ctx_verify_msg(
    const byte * sig,
    word32 siglen,
    const byte * msg,
    word32 msgLen,
    int * ret,
    ed25519_key * key,
)

```

```

    const byte * context,
    byte contextLen
)

```

This function verifies the Ed25519 signature of a message to ensure authenticity. The context is included as part of the data verified. It returns the answer through res, with 1 corresponding to a valid signature, and 0 corresponding to an invalid signature.

Parameters:

- **sig** Pointer to the buffer containing the signature to verify.
- **siglen** Length of the signature to verify.
- **msg** Pointer to the buffer containing the message to verify.
- **msgLen** Length of the message to verify.
- **res** Pointer to the result of the verification. 1 indicates the message was successfully verified.
- **key** Pointer to a public Ed25519 key with which to verify the signature.
- **context** Pointer to the buffer containing the context for which the message was signed.
- **contextLen** Length of the context buffer.

See:

- [wc_ed25519_verify_msg](#)
- [wc_ed25519ph_verify_hash](#)
- [wc_ed25519ph_verify_msg](#)
- [wc_ed25519_sign_msg](#)

Return:

- 0 Returned upon successfully performing the signature verification and authentication.
- BAD_FUNC_ARG Returned if any of the input parameters evaluate to NULL, or if the siglen does not match the actual length of a signature.
- SIG_VERIFY_E Returned if verification completes, but the signature generated does not match the signature provided.

Example

```

ed25519_key key;
int ret, verified = 0;

byte sig[] { initialize with received signature };
byte msg[] = { initialize with message };
byte context[] = { initialize with context of signature };
// initialize key with received public key
ret = wc_ed25519ctx_verify_msg(sig, sizeof(sig), msg, sizeof(msg),
    &verified, &key, );
if (ret < 0) {
    // error performing verification
} else if (verified == 0)
    // the signature is invalid
}

```

18.25.2.9 function wc_ed25519ph_verify_hash

```

WOLFSSL_API int wc_ed25519ph_verify_hash(
    const byte * sig,
    word32 siglen,
    const byte * hash,
    word32 hashLen,
    int * ret,

```

```

    ed25519_key * key,
    const byte * context,
    byte contextLen
)

```

This function verifies the Ed25519 signature of the digest of a message to ensure authenticity. The context is included as part of the data verified. The hash is the pre-hashed message before signature calculation. The hash algorithm used to create message digest must be SHA-512. The answer is returned through res, with 1 corresponding to a valid signature, and 0 corresponding to an invalid signature.

Parameters:

- **sig** Pointer to the buffer containing the signature to verify.
- **siglen** Length of the signature to verify.
- **hash** Pointer to the buffer containing the hash of the message to verify.
- **hashLen** Length of the hash to verify.
- **res** Pointer to the result of the verification. 1 indicates the message was successfully verified.
- **key** Pointer to a public Ed25519 key with which to verify the signature.
- **context** Pointer to the buffer containing the context for which the message was signed.
- **contextLen** Length of the context buffer.

See:

- [wc_ed25519_verify_msg](#)
- [wc_ed25519ctx_verify_msg](#)
- [wc_ed25519ph_verify_msg](#)
- [wc_ed25519_sign_msg](#)

Return:

- 0 Returned upon successfully performing the signature verification and authentication.
- BAD_FUNC_ARG Returned if any of the input parameters evaluate to NULL, or if the siglen does not match the actual length of a signature.
- SIG_VERIFY_E Returned if verification completes, but the signature generated does not match the signature provided.

Example

```

ed25519_key key;
int ret, verified = 0;

byte sig[] { initialize with received signature };
byte hash[] = { initialize with SHA-512 hash of message };
byte context[] = { initialize with context of signature };
// initialize key with received public key
ret = wc_ed25519ph_verify_hash(sig, sizeof(sig), msg, sizeof(msg),
    &verified, &key, );
if (ret < 0) {
    // error performing verification
} else if (verified == 0)
    // the signature is invalid
}

```

18.25.2.10 function wc_ed25519ph_verify_msg

```

WOLFSSL_API int wc_ed25519ph_verify_msg(
    const byte * sig,
    word32 siglen,

```

```

    const byte * msg,
    word32 msgLen,
    int * ret,
    ed25519_key * key,
    const byte * context,
    byte contextLen
)

```

This function verifies the Ed25519 signature of a message to ensure authenticity. The context is included as part of the data verified. The message is pre-hashed before verification. It returns the answer through res, with 1 corresponding to a valid signature, and 0 corresponding to an invalid signature.

Parameters:

- **sig** Pointer to the buffer containing the signature to verify.
- **siglen** Length of the signature to verify.
- **msg** Pointer to the buffer containing the message to verify.
- **msgLen** Length of the message to verify.
- **res** Pointer to the result of the verification. 1 indicates the message was successfully verified.
- **key** Pointer to a public Ed25519 key with which to verify the signature.
- **context** Pointer to the buffer containing the context for which the message was signed.
- **contextLen** Length of the context buffer.

See:

- [wc_ed25519_verify_msg](#)
- [wc_ed25519ph_verify_hash](#)
- [wc_ed25519ph_verify_msg](#)
- [wc_ed25519_sign_msg](#)

Return:

- 0 Returned upon successfully performing the signature verification and authentication.
- BAD_FUNC_ARG Returned if any of the input parameters evaluate to NULL, or if the siglen does not match the actual length of a signature.
- SIG_VERIFY_E Returned if verification completes, but the signature generated does not match the signature provided.

Example

```

ed25519_key key;
int ret, verified = 0;

byte sig[] { initialize with received signature };
byte msg[] = { initialize with message };
byte context[] = { initialize with context of signature };
// initialize key with received public key
ret = wc_ed25519ctx_verify_msg(sig, sizeof(sig), msg, sizeof(msg),
    &verified, &key, );
if (ret < 0) {
    // error performing verification
} else if (verified == 0)
    // the signature is invalid
}

```

18.25.2.11 function wc_ed25519_init

```
WOLFSSL_API int wc_ed25519_init(
```

```
    ed25519_key * key
)
```

This function initializes an ed25519_key object for future use with message verification.

Parameters:

- **key** Pointer to the ed25519_key object to initialize.

See:

- `wc_ed25519_make_key`
- `wc_ed25519_free`

Return:

- 0 Returned upon successfully initializing the ed25519_key object.
- BAD_FUNC_ARG Returned if key is NULL.

Example

```
ed25519_key key;
wc_ed25519_init(&key);
```

18.25.2.12 function wc_ed25519_free

```
WOLFSSL_API void wc_ed25519_free(
    ed25519_key * key
)
```

This function frees an Ed25519 object after it has been used.

Parameters:

- **key** Pointer to the ed25519_key object to free

See: `wc_ed25519_init`

Example

```
ed25519_key key;
// initialize key and perform secure exchanges
...
wc_ed25519_free(&key);
```

18.25.2.13 function wc_ed25519_import_public

```
WOLFSSL_API int wc_ed25519_import_public(
    const byte * in,
    word32 inLen,
    ed25519_key * key
)
```

This function imports a public ed25519_key pair from a buffer containing the public key. This function will handle both compressed and uncompressed keys.

Parameters:

- **in** Pointer to the buffer containing the public key.
- **inLen** Length of the buffer containing the public key.
- **key** Pointer to the ed25519_key object in which to store the public key.

See:

- `wc_ed25519_import_private_key`
- `wc_ed25519_export_public`

Return:

- 0 Returned on successfully importing the ed25519_key.
- BAD_FUNC_ARG Returned if in or key evaluate to NULL, or inLen is less than the size of an Ed25519 key.

Example

```
int ret;
byte pub[] = { initialize Ed25519 public key };

ed25519_key key;
wc_ed25519_init_key(&key);
ret = wc_ed25519_import_public(pub, sizeof(pub), &key);
if (ret != 0) {
    // error importing key
}
```

18.25.2.14 function wc_ed25519_import_private_only

```
WOLFSSL_API int wc_ed25519_import_private_only(
    const byte * priv,
    word32 privSz,
    ed25519_key * key
)
```

This function imports an Ed25519 private key only from a buffer.

Parameters:

- **priv** Pointer to the buffer containing the private key.
- **privSz** Length of the private key.
- **pub** Pointer to the buffer containing the public key.
- **pubSz** Length of the public key.
- **key** Pointer to the ed25519_key object in which to store the imported private key.

See:

- `wc_ed25519_import_public`
- `wc_ed25519_import_private_key`
- `wc_ed25519_export_private_only`

Return:

- 0 Returned on successfully importing the Ed25519 key.
- BAD_FUNC_ARG Returned if in or key evaluate to NULL, or if privSz is less than ED25519_KEY_SIZE.

Example

```
int ret;
byte priv[] = { initialize with 32 byte private key };

ed25519_key key;
wc_ed25519_init_key(&key);
ret = wc_ed25519_import_private_key(priv, sizeof(priv), &key);
if (ret != 0) {
    // error importing private key
}
```

18.25.2.15 function `wc_ed25519_import_private_key`

```
WOLFSSL_API int wc_ed25519_import_private_key(  
    const byte * priv,  
    word32 privSz,  
    const byte * pub,  
    word32 pubSz,  
    ed25519_key * key  
)
```

This function imports a public/private Ed25519 key pair from a pair of buffers. This function will handle both compressed and uncompressed keys.

Parameters:

- **priv** Pointer to the buffer containing the private key.
- **privSz** Length of the private key.
- **pub** Pointer to the buffer containing the public key.
- **pubSz** Length of the public key.
- **key** Pointer to the `ed25519_key` object in which to store the imported private/public key pair.

See:

- [wc_ed25519_import_public](#)
- [wc_ed25519_import_private_only](#)
- [wc_ed25519_export_private](#)

Return:

- 0 Returned on successfully importing the `ed25519_key`.
- `BAD_FUNC_ARG` Returned if in or key evaluate to NULL, or if either `privSz` is less than `ED25519_KEY_SIZE` or `pubSz` is less than `ED25519_PUB_KEY_SIZE`.

Example

```
int ret;  
byte priv[] = { initialize with 32 byte private key };  
byte pub[] = { initialize with the corresponding public key };  
  
ed25519_key key;  
wc_ed25519_init_key(&key);  
ret = wc_ed25519_import_private_key(priv, sizeof(priv), pub, sizeof(pub),  
    &key);  
if (ret != 0) {  
    // error importing key  
}
```

18.25.2.16 function `wc_ed25519_export_public`

```
WOLFSSL_API int wc_ed25519_export_public(  
    ed25519_key * ,  
    byte * out,  
    word32 * outLen  
)
```

This function exports the private key from an `ed25519_key` structure. It stores the public key in the buffer `out`, and sets the bytes written to this buffer in `outLen`.

Parameters:

- **key** Pointer to an `ed25519_key` structure from which to export the public key.

- **out** Pointer to the buffer in which to store the public key.
- **outLen** Pointer to a word32 object with the size available in out. Set with the number of bytes written to out after successfully exporting the public key.

See:

- [wc_ed25519_import_public](#)
- [wc_ed25519_export_private_only](#)

Return:

- 0 Returned upon successfully exporting the public key.
- BAD_FUNC_ARG Returned if any of the input values evaluate to NULL.
- BUFFER_E Returned if the buffer provided is not large enough to store the private key. Upon returning this error, the function sets the size required in outLen.

Example

```
int ret;
ed25519_key key;
// initialize key, make key

char pub[32];
word32 pubSz = sizeof(pub);

ret = wc_ed25519_export_public(&key, pub, &pubSz);
if (ret != 0) {
    // error exporting public key
}
```

18.25.2.17 function wc_ed25519_export_private_only

```
WOLFSSL_API int wc_ed25519_export_private_only(
    ed25519_key * key,
    byte * out,
    word32 * outLen
)
```

This function exports only the private key from an ed25519_key structure. It stores the private key in the buffer out, and sets the bytes written to this buffer in outLen.

Parameters:

- **key** Pointer to an ed25519_key structure from which to export the private key.
- **out** Pointer to the buffer in which to store the private key.
- **outLen** Pointer to a word32 object with the size available in out. Set with the number of bytes written to out after successfully exporting the private key.

See:

- [wc_ed25519_export_public](#)
- [wc_ed25519_import_private_key](#)

Return:

- 0 Returned upon successfully exporting the private key.
- ECC_BAD_ARG_E Returned if any of the input values evaluate to NULL.
- BUFFER_E Returned if the buffer provided is not large enough to store the private key.

Example

```

int ret;
ed25519_key key;
// initialize key, make key

char priv[32]; // 32 bytes because only private key
word32 privSz = sizeof(priv);
ret = wc_ed25519_export_private_only(&key, priv, &privSz);
if (ret != 0) {
    // error exporting private key
}

```

18.25.2.18 function wc_ed25519_export_private

```

WOLFSSL_API int wc_ed25519_export_private(
    ed25519_key * key,
    byte * out,
    word32 * outLen
)

```

This function exports the key pair from an ed25519_key structure. It stores the key pair in the buffer out, and sets the bytes written to this buffer in outLen.

Parameters:

- **key** Pointer to an ed25519_key structure from which to export the key pair.
- **out** Pointer to the buffer in which to store the key pair.
- **outLen** Pointer to a word32 object with the size available in out. Set with the number of bytes written to out after successfully exporting the key pair.

See:

- [wc_ed25519_import_private_key](#)
- [wc_ed25519_export_private_only](#)

Return:

- 0 Returned upon successfully exporting the key pair.
- ECC_BAD_ARG_E Returned if any of the input values evaluate to NULL.
- BUFFER_E Returned if the buffer provided is not large enough to store the key pair.

Example

```

ed25519_key key;
wc_ed25519_init(&key);

WC_RNG rng;
wc_InitRng(&rng);

wc_ed25519_make_key(&rng, 32, &key); // initialize 32 byte Ed25519 key

byte out[64]; // out needs to be a sufficient buffer size
word32 outLen = sizeof(out);
int key_size = wc_ed25519_export_private(&key, out, &outLen);
if (key_size == BUFFER_E) {
    // Check size of out compared to outLen to see if function reset outLen
}

```

18.25.2.19 function wc_ed25519_export_key

```
WOLFSSL_API int wc_ed25519_export_key(
    ed25519_key * key,
    byte * priv,
    word32 * privSz,
    byte * pub,
    word32 * pubSz
)
```

This function exports the private and public key separately from an `ed25519_key` structure. It stores the private key in the buffer `priv`, and sets the bytes written to this buffer in `privSz`. It stores the public key in the buffer `pub`, and sets the bytes written to this buffer in `pubSz`.

Parameters:

- **key** Pointer to an `ed25519_key` structure from which to export the key pair.
- **priv** Pointer to the buffer in which to store the private key.
- **privSz** Pointer to a `word32` object with the size available in out. Set with the number of bytes written to out after successfully exporting the private key.
- **pub** Pointer to the buffer in which to store the public key.
- **pubSz** Pointer to a `word32` object with the size available in out. Set with the number of bytes written to out after successfully exporting the public key.

See:

- [wc_ed25519_export_private](#)
- [wc_ed25519_export_public](#)

Return:

- 0 Returned upon successfully exporting the key pair.
- `ECC_BAD_ARG_E` Returned if any of the input values evaluate to NULL.
- `BUFFER_E` Returned if the buffer provided is not large enough to store the key pair.

Example

```
int ret;
ed25519_key key;
// initialize key, make key

char pub[32];
word32 pubSz = sizeof(pub);
char priv[32];
word32 privSz = sizeof(priv);

ret = wc_ed25519_export_key(&key, priv, &pubSz, pub, &pubSz);
if (ret != 0) {
    // error exporting public key
}
```

18.25.2.20 function `wc_ed25519_check_key`

```
WOLFSSL_API int wc_ed25519_check_key(
    ed25519_key * key
)
```

This function checks the public key in `ed25519_key` structure matches the private key.

Parameters:

- **key** Pointer to an `ed25519_key` structure holding a private and public key.

See: [wc_ed25519_import_private_key](#)

Return:

- 0 Returned if the private and public key matched.
- BAD_FUNC_ARGS Returned if the given key is NULL.

Example

```
int ret;
byte priv[] = { initialize with 57 byte private key };
byte pub[] = { initialize with the corresponding public key };

ed25519_key key;
wc_ed25519_init_key(&key);
wc_ed25519_import_private_key(priv, sizeof(priv), pub, sizeof(pub), &key);
ret = wc_ed25519_check_key(&key);
if (ret != 0) {
    // error checking key
}
```

18.25.2.21 function wc_ed25519_size

```
WOLFSSL_API int wc_ed25519_size(
    ed25519_key * key
)
```

This function returns the size of an Ed25519 - 32 bytes.

Parameters:

- **key** Pointer to an ed25519_key structure for which to get the key size.

See: [wc_ed25519_make_key](#)

Return:

- ED25519_KEY_SIZE The size of a valid private key (32 bytes).
- BAD_FUNC_ARGS Returned if the given key is NULL.

Example

```
int keySz;
ed25519_key key;
// initialize key, make key
keySz = wc_ed25519_size(&key);
if (keySz == 0) {
    // error determining key size
}
```

18.25.2.22 function wc_ed25519_priv_size

```
WOLFSSL_API int wc_ed25519_priv_size(
    ed25519_key * key
)
```

This function returns the private key size (secret + public) in bytes.

Parameters:

- **key** Pointer to an ed25519_key structure for which to get the key size.

See: [wc_ed25519_pub_size](#)

Return:

- ED25519_PRV_KEY_SIZE The size of the private key (64 bytes).
- BAD_FUNC_ARG Returned if key argument is NULL.

Example

```
ed25519_key key;  
wc_ed25519_init(&key);
```

```
WC_RNG rng;  
wc_InitRng(&rng);
```

```
wc_ed25519_make_key(&rng, 32, &key); // initialize 32 byte Ed25519 key  
int key_size = wc_ed25519_priv_size(&key);
```

18.25.2.23 function wc_ed25519_pub_size

```
WOLFSSL_API int wc_ed25519_pub_size(  
    ed25519_key * key  
)
```

This function returns the compressed key size in bytes (public key).

Parameters:

- **key** Pointer to an ed25519_key structure for which to get the key size.

See: [wc_ed25519_priv_size](#)

Return:

- ED25519_PUB_KEY_SIZE The size of the compressed public key (32 bytes).
- BAD_FUNC_ARG Returns if key argument is NULL.

Example

```
ed25519_key key;  
wc_ed25519_init(&key);  
WC_RNG rng;  
wc_InitRng(&rng);
```

```
wc_ed25519_make_key(&rng, 32, &key); // initialize 32 byte Ed25519 key  
int key_size = wc_ed25519_pub_size(&key);
```

18.25.2.24 function wc_ed25519_sig_size

```
WOLFSSL_API int wc_ed25519_sig_size(  
    ed25519_key * key  
)
```

This function returns the size of an Ed25519 signature (64 in bytes).

Parameters:

- **key** Pointer to an ed25519_key structure for which to get the signature size.

See: [wc_ed25519_sign_msg](#)

Return:

- ED25519_SIG_SIZE The size of an Ed25519 signature (64 bytes).
- BAD_FUNC_ARG Returns if key argument is NULL.

Example

```
int sigSz;
ed25519_key key;
// initialize key, make key

sigSz = wc_ed25519_sig_size(&key);
if (sigSz == 0) {
    // error determining sig size
}
```

18.26 Algorithms - ED448

18.26.1 Functions

	Name
WOLFSSL_API int	wc_ed448_make_public (ed448_key * key, unsigned char * pubKey, word32 pubKeySz)This function generates a new Ed448 public key from the private key.
WOLFSSL_API int	wc_ed448_make_key (WC_RNG * rng, int keysize, ed448_key * key)This function generates a new Ed448 key pair.
WOLFSSL_API int	wc_ed448_sign_msg (const byte * in, word32 inLen, byte * out, word32 * outLen, ed448_key * key)This function signs a message with the private key.
WOLFSSL_API int	wc_ed448ph_sign_hash (const byte * hash, word32 hashLen, byte * out, word32 * outLen, ed448_key * key)This function signs a hash with the private key.
WOLFSSL_API int	wc_ed448ph_sign_msg (const byte * in, word32 inLen, byte * out, word32 * outLen, ed448_key * key)This function signs a message with the private key.
WOLFSSL_API int	wc_ed448_verify_msg (const byte * sig, word32 sigLen, const byte * msg, word32 msgLen, int * ret, ed448_key * key)This function verifies a message with the public key.
WOLFSSL_API int	wc_ed448ph_verify_hash (const byte * sig, word32 sigLen, const byte * hash, word32 hashLen, int * ret, ed448_key * key)This function verifies a hash with the public key.
WOLFSSL_API int	wc_ed448ph_verify_msg (const byte * sig, word32 sigLen, const byte * msg, word32 msgLen, int * ret, ed448_key * key)This function verifies a message with the public key.
WOLFSSL_API int	wc_ed448_init (ed448_key * key)This function initializes an ed448_key object for future use with the library.
WOLFSSL_API void	wc_ed448_free (ed448_key * key)This function frees an Ed448 object after it has been used.
WOLFSSL_API int	wc_ed448_import_public (const byte * in, word32 inLen, ed448_key * key)This function imports a public key from a buffer.
WOLFSSL_API int	wc_ed448_import_private_only (const byte * priv, word32 privSz, ed448_key * key)This function imports a private key from a buffer.
WOLFSSL_API int	wc_ed448_import_private_key (const byte * priv, word32 privSz, const byte * pub, word32 pubSz, ed448_key * key)This function imports a private key and a public key from buffers.
WOLFSSL_API int	wc_ed448_export_public (ed448_key * key, byte * out, word32 * outLen)This function exports the public key to a buffer.
WOLFSSL_API int	wc_ed448_export_private_only (ed448_key * key, byte * out, word32 * outLen)This function exports the private key to a buffer.
WOLFSSL_API int	wc_ed448_export_private (ed448_key * key, byte * out, word32 * outLen)This function exports the private key to a buffer.
WOLFSSL_API int	wc_ed448_export_key (ed448_key * key, byte * priv, word32 * privSz, byte * pub, word32 * pubSz)This function exports the private and public keys to buffers.
WOLFSSL_API int	wc_ed448_check_key (ed448_key * key)This function checks the public key in ed448_key structure is valid.
WOLFSSL_API int	wc_ed448_size (ed448_key * key)This function returns the size of an Ed448 private key - 57 bytes.
WOLFSSL_API int	wc_ed448_priv_size (ed448_key * key)This function returns the private key size (secret + public).
WOLFSSL_API int	wc_ed448_pub_size (ed448_key * key)This function returns the compressed key size in bytes (public).
WOLFSSL_API int	wc_ed448_sig_size (ed448_key * key)This function returns the size of an Ed448 signature (114 bytes).

18.26.2 Functions Documentation

18.26.2.1 function wc_ed448_make_public

```
WOLFSSL_API int wc_ed448_make_public(
    ed448_key * key,
    unsigned char * pubKey,
    word32 pubKeySz
)
```

This function generates the Ed448 public key from the private key. It stores the public key in the buffer pubKey, and sets the bytes written to this buffer in pubKeySz.

Parameters:

- **key** Pointer to the ed448_key for which to generate a key.
- **out** Pointer to the buffer in which to store the public key.
- **outLen** Pointer to a word32 object with the size available in out. Set with the number of bytes written to out after successfully exporting the public key.

See:

- [wc_ed448_init](#)
- [wc_ed448_import_private_only](#)
- [wc_ed448_make_key](#)

Return:

- 0 Returned upon successfully making the public key.
- BAD_FUNC_ARG Returned if key or pubKey evaluate to NULL, or if the specified key size is not 57 bytes (Ed448 has 57 byte keys).
- MEMORY_E Returned if there is an error allocating memory during function execution.

Example

```
int ret;

ed448_key key;
byte priv[] = { initialize with 57 byte private key };
byte pub[57];
word32 pubSz = sizeof(pub);

wc_ed448_init(&key);
wc_ed448_import_private_only(priv, sizeof(priv), &key);
ret = wc_ed448_make_public(&key, pub, &pubSz);
if (ret != 0) {
    // error making public key
}
```

18.26.2.2 function wc_ed448_make_key

```
WOLFSSL_API int wc_ed448_make_key(
    WC_RNG * rng,
    int keysize,
    ed448_key * key
)
```

This function generates a new Ed448 key and stores it in key.

Parameters:

- **rng** Pointer to an initialized RNG object with which to generate the key.
- **keysize** Length of key to generate. Should always be 57 for Ed448.
- **key** Pointer to the ed448_key for which to generate a key.

See: [wc_ed448_init](#)**Return:**

- 0 Returned upon successfully making an ed448_key.
- BAD_FUNC_ARG Returned if rng or key evaluate to NULL, or if the specified key size is not 57 bytes (Ed448 has 57 byte keys).
- MEMORY_E Returned if there is an error allocating memory during function execution.

Example

```
int ret;

WC_RNG rng;
ed448_key key;

wc_InitRng(&rng);
wc_ed448_init(&key);
ret = wc_ed448_make_key(&rng, 57, &key);
if (ret != 0) {
    // error making key
}
```

18.26.2.3 function `wc_ed448_sign_msg`

```
WOLFSSL_API int wc_ed448_sign_msg(
    const byte * in,
    word32 inlen,
    byte * out,
    word32 * outlen,
    ed448_key * key
)
```

This function signs a message using an `ed448_key` object to guarantee authenticity.

Parameters:

- **in** Pointer to the buffer containing the message to sign.
- **inlen** Length of the message to sign.
- **out** Buffer in which to store the generated signature.
- **outlen** Maximum length of the output buffer. Will store the bytes written to out upon successfully generating a message signature.
- **key** Pointer to a private `ed448_key` with which to generate the signature.

See:

- `wc_ed448ph_sign_hash`
- `wc_ed448ph_sign_msg`
- `wc_ed448_verify_msg`

Return:

- 0 Returned upon successfully generating a signature for the message.
- `BAD_FUNC_ARG` Returned if any of the input parameters evaluate to NULL, or if the output buffer is too small to store the generated signature.
- `MEMORY_E` Returned if there is an error allocating memory during function execution.

Example

```
ed448_key key;
WC_RNG rng;
int ret, sigSz;

byte sig[114]; // will hold generated signature
sigSz = sizeof(sig);
byte message[] = { initialize with message };

wc_InitRng(&rng); // initialize rng
```

```

wc_ed448_init(&key); // initialize key
wc_ed448_make_key(&rng, 57, &key); // make public/private key pair
ret = wc_ed448_sign_msg(message, sizeof(message), sig, &sigSz, &key);
if (ret != 0) {
    // error generating message signature
}

```

18.26.2.4 function wc_ed448ph_sign_hash

```

WOLFSSL_API int wc_ed448ph_sign_hash(
    const byte * hash,
    word32 hashLen,
    byte * out,
    word32 * outLen,
    ed448_key * key,
    const byte * context,
    byte contextLen
)

```

This function signs a message digest using an ed448_key object to guarantee authenticity. The context is included as part of the data signed. The hash is the pre-hashed message before signature calculation. The hash algorithm used to create message digest must be SHAKE-256.

Parameters:

- **hash** Pointer to the buffer containing the hash of the message to sign.
- **hashLen** Length of the hash of the message to sign.
- **out** Buffer in which to store the generated signature.
- **outlen** Maximum length of the output buffer. Will store the bytes written to out upon successfully generating a message signature.
- **key** Pointer to a private ed448_key with which to generate the signature.
- **context** Pointer to the buffer containing the context for which message is being signed.
- **contextLen** Length of the context buffer.

See:

- [wc_ed448_sign_msg](#)
- [wc_ed448ph_sign_msg](#)
- [wc_ed448ph_verify_hash](#)

Return:

- 0 Returned upon successfully generating a signature for the message digest.
- BAD_FUNC_ARG Returned any of the input parameters evaluate to NULL, or if the output buffer is too small to store the generated signature.
- MEMORY_E Returned if there is an error allocating memory during function execution.

Example

```

ed448_key key;
WC_RNG rng;
int ret, sigSz;

byte sig[114]; // will hold generated signature
sigSz = sizeof(sig);
byte hash[] = { initialize with SHAKE-256 hash of message };
byte context[] = { initialize with context of signing };

wc_InitRng(&rng); // initialize rng

```

```

wc_ed448_init(&key); // initialize key
wc_ed448_make_key(&rng, 57, &key); // make public/private key pair
ret = wc_ed448ph_sign_hash(hash, sizeof(hash), sig, &sigSz, &key,
    context, sizeof(context));
if (ret != 0) {
    // error generating message signature
}

```

18.26.2.5 function wc_ed448ph_sign_msg

```

WOLFSSL_API int wc_ed448ph_sign_msg(
    const byte * in,
    word32 inLen,
    byte * out,
    word32 * outLen,
    ed448_key * key,
    const byte * context,
    byte contextLen
)

```

This function signs a message using an ed448_key object to guarantee authenticity. The context is included as part of the data signed. The message is pre-hashed before signature calculation.

Parameters:

- **in** Pointer to the buffer containing the message to sign.
- **inlen** Length of the message to sign.
- **out** Buffer in which to store the generated signature.
- **outlen** Maximum length of the output buffer. Will store the bytes written to out upon successfully generating a message signature.
- **key** Pointer to a private ed448_key with which to generate the signature.
- **context** Pointer to the buffer containing the context for which message is being signed.
- **contextLen** Length of the context buffer.

See:

- [wc_ed448_sign_msg](#)
- [wc_ed448ph_sign_hash](#)
- [wc_ed448ph_verify_msg](#)

Return:

- 0 Returned upon successfully generating a signature for the message.
- BAD_FUNC_ARG Returned any of the input parameters evaluate to NULL, or if the output buffer is too small to store the generated signature.
- MEMORY_E Returned if there is an error allocating memory during function execution.

Example

```

ed448_key key;
WC_RNG rng;
int ret, sigSz;

byte sig[114]; // will hold generated signature
sigSz = sizeof(sig);
byte message[] = { initialize with message };
byte context[] = { initialize with context of signing };

wc_InitRng(&rng); // initialize rng

```

```

wc_ed448_init(&key); // initialize key
wc_ed448_make_key(&rng, 57, &key); // make public/private key pair
ret = wc_ed448ph_sign_msg(message, sizeof(message), sig, &sigSz, &key,
    context, sizeof(context));
if (ret != 0) {
    // error generating message signature
}

```

18.26.2.6 function wc_ed448_verify_msg

```

WOLFSSL_API int wc_ed448_verify_msg(
    const byte * sig,
    word32 siglen,
    const byte * msg,
    word32 msgLen,
    int * res,
    ed448_key * key,
    const byte * context,
    byte contextLen
)

```

This function verifies the Ed448 signature of a message to ensure authenticity. The context is included as part of the data verified. The answer is returned through res, with 1 corresponding to a valid signature, and 0 corresponding to an invalid signature.

Parameters:

- **sig** Pointer to the buffer containing the signature to verify.
- **siglen** Length of the signature to verify.
- **msg** Pointer to the buffer containing the message to verify.
- **msgLen** Length of the message to verify.
- **key** Pointer to a public Ed448 key with which to verify the signature.
- **context** Pointer to the buffer containing the context for which the message was signed.
- **contextLen** Length of the context buffer.

See:

- [wc_ed448ph_verify_hash](#)
- [wc_ed448ph_verify_msg](#)
- [wc_ed448_sign_msg](#)

Return:

- 0 Returned upon successfully performing the signature verification and authentication.
- BAD_FUNC_ARG Returned if any of the input parameters evaluate to NULL, or if the siglen does not match the actual length of a signature.
- SIG_VERIFY_E Returned if verification completes, but the signature generated does not match the signature provided.

Example

```

ed448_key key;
int ret, verified = 0;

byte sig[] { initialize with received signature };
byte msg[] = { initialize with message };
byte context[] = { initialize with context of signature };
// initialize key with received public key
ret = wc_ed448_verify_msg(sig, sizeof(sig), msg, sizeof(msg), &verified,

```

```

        &key, context, sizeof(context));
if (ret < 0) {
    // error performing verification
} else if (verified == 0)
    // the signature is invalid
}

```

18.26.2.7 function wc_ed448ph_verify_hash

```

WOLFSSL_API int wc_ed448ph_verify_hash(
    const byte * sig,
    word32 siglen,
    const byte * hash,
    word32 hashlen,
    int * res,
    ed448_key * key,
    const byte * context,
    byte contextLen
)

```

This function verifies the Ed448 signature of the digest of a message to ensure authenticity. The context is included as part of the data verified. The hash is the pre-hashed message before signature calculation. The hash algorithm used to create message digest must be SHAKE-256. The answer is returned through res, with 1 corresponding to a valid signature, and 0 corresponding to an invalid signature.

Parameters:

- **sig** Pointer to the buffer containing the signature to verify.
- **siglen** Length of the signature to verify.
- **hash** Pointer to the buffer containing the hash of the message to verify.
- **hashLen** Length of the hash to verify.
- **key** Pointer to a public Ed448 key with which to verify the signature.
- **context** Pointer to the buffer containing the context for which the message was signed.
- **contextLen** Length of the context buffer.

See:

- [wc_ed448_verify_msg](#)
- [wc_ed448ph_verify_msg](#)
- [wc_ed448ph_sign_hash](#)

Return:

- 0 Returned upon successfully performing the signature verification and authentication.
- BAD_FUNC_ARG Returned if any of the input parameters evaluate to NULL, or if the siglen does not match the actual length of a signature.
- SIG_VERIFY_E Returned if verification completes, but the signature generated does not match the signature provided.

Example

```

ed448_key key;
int ret, verified = 0;

byte sig[] { initialize with received signature };
byte hash[] = { initialize with SHAKE-256 hash of message };
byte context[] = { initialize with context of signature };
// initialize key with received public key

```

```

ret = wc_ed448ph_verify_hash(sig, sizeof(sig), hash, sizeof(hash),
    &verified, &key, context, sizeof(context));
if (ret < 0) {
    // error performing verification
} else if (verified == 0)
    // the signature is invalid
}

```

18.26.2.8 function wc_ed448ph_verify_msg

```

WOLFSSL_API int wc_ed448ph_verify_msg(
    const byte * sig,
    word32 siglen,
    const byte * msg,
    word32 msgLen,
    int * res,
    ed448_key * key,
    const byte * context,
    byte contextLen
)

```

This function verifies the Ed448 signature of a message to ensure authenticity. The context is included as part of the data verified. The message is pre-hashed before verification. The answer is returned through res, with 1 corresponding to a valid signature, and 0 corresponding to an invalid signature.

Parameters:

- **sig** Pointer to the buffer containing the signature to verify.
- **siglen** Length of the signature to verify.
- **msg** Pointer to the buffer containing the message to verify.
- **msgLen** Length of the message to verify.
- **key** Pointer to a public Ed448 key with which to verify the signature.
- **context** Pointer to the buffer containing the context for which the message was signed.
- **contextLen** Length of the context buffer.

See:

- [wc_ed448_verify_msg](#)
- [wc_ed448ph_verify_hash](#)
- [wc_ed448ph_sign_msg](#)

Return:

- 0 Returned upon successfully performing the signature verification and authentication.
- BAD_FUNC_ARG Returned if any of the input parameters evaluate to NULL, or if the siglen does not match the actual length of a signature.
- SIG_VERIFY_E Returned if verification completes, but the signature generated does not match the signature provided.

Example

```

ed448_key key;
int ret, verified = 0;

byte sig[] { initialize with received signature };
byte msg[] = { initialize with message };
byte context[] = { initialize with context of signature };
// initialize key with received public key
ret = wc_ed448ph_verify_msg(sig, sizeof(sig), msg, sizeof(msg), &verified,

```

```

        &key, context, sizeof(context));
if (ret < 0) {
    // error performing verification
} else if (verified == 0)
    // the signature is invalid
}

```

18.26.2.9 function wc_ed448_init

```

WOLFSSL_API int wc_ed448_init(
    ed448_key * key
)

```

This function initializes an ed448_key object for future use with message verification.

Parameters:

- **key** Pointer to the ed448_key object to initialize.

See:

- [wc_ed448_make_key](#)
- [wc_ed448_free](#)

Return:

- 0 Returned upon successfully initializing the ed448_key object.
- BAD_FUNC_ARG Returned if key is NULL.

Example

```

ed448_key key;
wc_ed448_init(&key);

```

18.26.2.10 function wc_ed448_free

```

WOLFSSL_API void wc_ed448_free(
    ed448_key * key
)

```

This function frees an Ed448 object after it has been used.

Parameters:

- **key** Pointer to the ed448_key object to free

See: [wc_ed448_init](#)

Example

```

ed448_key key;
// initialize key and perform secure exchanges
...
wc_ed448_free(&key);

```

18.26.2.11 function wc_ed448_import_public

```

WOLFSSL_API int wc_ed448_import_public(
    const byte * in,
    word32 inLen,
    ed448_key * key
)

```

This function imports a public ed448_key pair from a buffer containing the public key. This function will handle both compressed and uncompressed keys.

Parameters:

- **in** Pointer to the buffer containing the public key.
- **inLen** Length of the buffer containing the public key.
- **key** Pointer to the ed448_key object in which to store the public key.

See:

- [wc_ed448_import_private_key](#)
- [wc_ed448_export_public](#)

Return:

- 0 Returned on successfully importing the ed448_key.
- BAD_FUNC_ARG Returned if in or key evaluate to NULL, or inLen is less than the size of an Ed448 key.

Example

```
int ret;
byte pub[] = { initialize Ed448 public key };

ed_448 key;
wc_ed448_init_key(&key);
ret = wc_ed448_import_public(pub, sizeof(pub), &key);
if (ret != 0) {
    // error importing key
}
```

18.26.2.12 function wc_ed448_import_private_only

```
WOLFSSL_API int wc_ed448_import_private_only(
    const byte * priv,
    word32 privSz,
    ed448_key * key
)
```

This function imports an Ed448 private key only from a buffer.

Parameters:

- **priv** Pointer to the buffer containing the private key.
- **privSz** Length of the private key.
- **key** Pointer to the ed448_key object in which to store the imported private key.

See:

- [wc_ed448_import_public](#)
- [wc_ed448_import_private_key](#)
- [wc_ed448_export_private_only](#)

Return:

- 0 Returned on successfully importing the Ed448 private key.
- BAD_FUNC_ARG Returned if in or key evaluate to NULL, or if privSz is less than ED448_KEY_SIZE.

Example

```

int ret;
byte priv[] = { initialize with 57 byte private key };

ed448_key key;
wc_ed448_init_key(&key);
ret = wc_ed448_import_private_only(priv, sizeof(priv), &key);
if (ret != 0) {
    // error importing private key
}

```

18.26.2.13 function wc_ed448_import_private_key

```

WOLFSSL_API int wc_ed448_import_private_key(
    const byte * priv,
    word32 privSz,
    const byte * pub,
    word32 pubSz,
    ed448_key * key
)

```

This function imports a public/private Ed448 key pair from a pair of buffers. This function will handle both compressed and uncompressed keys.

Parameters:

- **priv** Pointer to the buffer containing the private key.
- **privSz** Length of the private key.
- **pub** Pointer to the buffer containing the public key.
- **pubSz** Length of the public key.
- **key** Pointer to the ed448_key object in which to store the imported private/public key pair.

See:

- [wc_ed448_import_public](#)
- [wc_ed448_import_private_only](#)
- [wc_ed448_export_private](#)

Return:

- 0 Returned on successfully importing the Ed448 key.
- BAD_FUNC_ARG Returned if in or key evaluate to NULL, or if either privSz is less than ED448_KEY_SIZE or pubSz is less than ED448_PUB_KEY_SIZE.

Example

```

int ret;
byte priv[] = { initialize with 57 byte private key };
byte pub[] = { initialize with the corresponding public key };

ed448_key key;
wc_ed448_init_key(&key);
ret = wc_ed448_import_private_key(priv, sizeof(priv), pub, sizeof(pub),
    &key);
if (ret != 0) {
    // error importing key
}

```

18.26.2.14 function wc_ed448_export_public

```
WOLFSSL_API int wc_ed448_export_public(
    ed448_key * ,
    byte * out,
    word32 * outLen
)
```

This function exports the private key from an `ed448_key` structure. It stores the public key in the buffer `out`, and sets the bytes written to this buffer in `outLen`.

Parameters:

- **key** Pointer to an `ed448_key` structure from which to export the public key.
- **out** Pointer to the buffer in which to store the public key.
- **outLen** Pointer to a `word32` object with the size available in `out`. Set with the number of bytes written to `out` after successfully exporting the public key.

See:

- [wc_ed448_import_public](#)
- [wc_ed448_export_private_only](#)

Return:

- 0 Returned upon successfully exporting the public key.
- `BAD_FUNC_ARG` Returned if any of the input values evaluate to NULL.
- `BUFFER_E` Returned if the buffer provided is not large enough to store the private key. Upon returning this error, the function sets the size required in `outLen`.

Example

```
int ret;
ed448_key key;
// initialize key, make key

char pub[57];
word32 pubSz = sizeof(pub);

ret = wc_ed448_export_public(&key, pub, &pubSz);
if (ret != 0) {
    // error exporting public key
}
```

18.26.2.15 function `wc_ed448_export_private_only`

```
WOLFSSL_API int wc_ed448_export_private_only(
    ed448_key * key,
    byte * out,
    word32 * outLen
)
```

This function exports only the private key from an `ed448_key` structure. It stores the private key in the buffer `out`, and sets the bytes written to this buffer in `outLen`.

Parameters:

- **key** Pointer to an `ed448_key` structure from which to export the private key.
- **out** Pointer to the buffer in which to store the private key.
- **outLen** Pointer to a `word32` object with the size available in `out`. Set with the number of bytes written to `out` after successfully exporting the private key.

See:

- `wc_ed448_export_public`
- `wc_ed448_import_private_key`

Return:

- 0 Returned upon successfully exporting the private key.
- `ECC_BAD_ARG_E` Returned if any of the input values evaluate to NULL.
- `BUFFER_E` Returned if the buffer provided is not large enough to store the private key.

Example

```
int ret;
ed448_key key;
// initialize key, make key

char priv[57]; // 57 bytes because only private key
word32 privSz = sizeof(priv);
ret = wc_ed448_export_private_only(&key, priv, &privSz);
if (ret != 0) {
    // error exporting private key
}
```

18.26.2.16 function `wc_ed448_export_private`

```
WOLFSSL_API int wc_ed448_export_private(
    ed448_key * key,
    byte * out,
    word32 * outLen
)
```

This function exports the key pair from an `ed448_key` structure. It stores the key pair in the buffer `out`, and sets the bytes written to this buffer in `outLen`.

Parameters:

- **key** Pointer to an `ed448_key` structure from which to export the key pair.
- **out** Pointer to the buffer in which to store the key pair.
- **outLen** Pointer to a `word32` object with the size available in `out`. Set with the number of bytes written to `out` after successfully exporting the key pair.

See:

- `wc_ed448_import_private`
- `wc_ed448_export_private_only`

Return:

- 0 Returned upon successfully exporting the key pair.
- `ECC_BAD_ARG_E` Returned if any of the input values evaluate to NULL.
- `BUFFER_E` Returned if the buffer provided is not large enough to store the key pair.

Example

```
ed448_key key;
wc_ed448_init(&key);

WC_RNG rng;
wc_InitRng(&rng);

wc_ed448_make_key(&rng, 57, &key); // initialize 57 byte Ed448 key
```

```

byte out[114]; // out needs to be a sufficient buffer size
word32 outLen = sizeof(out);
int key_size = wc_ed448_export_private(&key, out, &outLen);
if (key_size == BUFFER_E) {
    // Check size of out compared to outLen to see if function reset outLen
}

```

18.26.2.17 function wc_ed448_export_key

```

WOLFSSL_API int wc_ed448_export_key(
    ed448_key * key,
    byte * priv,
    word32 * privSz,
    byte * pub,
    word32 * pubSz
)

```

This function exports the private and public key separately from an `ed448_key` structure. It stores the private key in the buffer `priv`, and sets the bytes written to this buffer in `privSz`. It stores the public key in the buffer `pub`, and sets the bytes written to this buffer in `pubSz`.

Parameters:

- **key** Pointer to an `ed448_key` structure from which to export the key pair.
- **priv** Pointer to the buffer in which to store the private key.
- **privSz** Pointer to a `word32` object with the size available in out. Set with the number of bytes written to out after successfully exporting the private key.
- **pub** Pointer to the buffer in which to store the public key.
- **pubSz** Pointer to a `word32` object with the size available in out. Set with the number of bytes written to out after successfully exporting the public key.

See:

- [wc_ed448_export_private](#)
- [wc_ed448_export_public](#)

Return:

- 0 Returned upon successfully exporting the key pair.
- `ECC_BAD_ARG_E` Returned if any of the input values evaluate to NULL.
- `BUFFER_E` Returned if the buffer provided is not large enough to store the key pair.

Example

```

int ret;
ed448_key key;
// initialize key, make key

char pub[57];
word32 pubSz = sizeof(pub);
char priv[57];
word32 privSz = sizeof(priv);

ret = wc_ed448_export_key(&key, priv, &pubSz, pub, &pubSz);
if (ret != 0) {
    // error exporting private and public key
}

```

18.26.2.18 function wc_ed448_check_key

```
WOLFSSL_API int wc_ed448_check_key(  
    ed448_key * key  
)
```

This function checks the public key in ed448_key structure matches the private key.

Parameters:

- **key** Pointer to an ed448_key structure holding a private and public key.

See: [wc_ed448_import_private_key](#)

Return:

- 0 Returned if the private and public key matched.
- BAD_FUNC_ARGS Returned if the given key is NULL.

Example

```
int ret;  
byte priv[] = { initialize with 57 byte private key };  
byte pub[] = { initialize with the corresponding public key };  
  
ed448_key key;  
wc_ed448_init_key(&key);  
wc_ed448_import_private_key(priv, sizeof(priv), pub, sizeof(pub), &key);  
ret = wc_ed448_check_key(&key);  
if (ret != 0) {  
    // error checking key  
}
```

18.26.2.19 function wc_ed448_size

```
WOLFSSL_API int wc_ed448_size(  
    ed448_key * key  
)
```

This function returns the size of an Ed448 private key - 57 bytes.

Parameters:

- **key** Pointer to an ed448_key structure for which to get the key size.

See: [wc_ed448_make_key](#)

Return:

- ED448_KEY_SIZE The size of a valid private key (57 bytes).
- BAD_FUNC_ARGS Returned if the given key is NULL.

Example

```
int keySz;  
ed448_key key;  
// initialize key, make key  
keySz = wc_ed448_size(&key);  
if (keySz == 0) {  
    // error determining key size  
}
```

18.26.2.20 function `wc_ed448_priv_size`

```
WOLFSSL_API int wc_ed448_priv_size(  
    ed448_key * key  
)
```

This function returns the private key size (secret + public) in bytes.

Parameters:

- **key** Pointer to an `ed448_key` structure for which to get the key size.

See: `wc_ed448_pub_size`

Return:

- `ED448_PRV_KEY_SIZE` The size of the private key (114 bytes).
- `BAD_FUNC_ARG` Returns if key argument is NULL.

Example

```
ed448_key key;  
wc_ed448_init(&key);  
  
WC_RNG rng;  
wc_InitRng(&rng);  
  
wc_ed448_make_key(&rng, 57, &key); // initialize 57 byte Ed448 key  
int key_size = wc_ed448_priv_size(&key);
```

18.26.2.21 function `wc_ed448_pub_size`

```
WOLFSSL_API int wc_ed448_pub_size(  
    ed448_key * key  
)
```

This function returns the compressed key size in bytes (public key).

Parameters:

- **key** Pointer to an `ed448_key` structure for which to get the key size.

See: `wc_ed448_priv_size`

Return:

- `ED448_PUB_KEY_SIZE` The size of the compressed public key (57 bytes).
- `BAD_FUNC_ARG` Returns if key argument is NULL.

Example

```
ed448_key key;  
wc_ed448_init(&key);  
WC_RNG rng;  
wc_InitRng(&rng);  
  
wc_ed448_make_key(&rng, 57, &key); // initialize 57 byte Ed448 key  
int key_size = wc_ed448_pub_size(&key);
```

18.26.2.22 function `wc_ed448_sig_size`

```
WOLFSSL_API int wc_ed448_sig_size(
    ed448_key * key
)
```

This function returns the size of an Ed448 signature (114 in bytes).

Parameters:

- **key** Pointer to an ed448_key structure for which to get the signature size.

See: `wc_ed448_sign_msg`

Return:

- ED448_SIG_SIZE The size of an Ed448 signature (114 bytes).
- BAD_FUNC_ARG Returns if key argument is NULL.

Example

```
int sigSz;
ed448_key key;
// initialize key, make key

sigSz = wc_ed448_sig_size(&key);
if (sigSz == 0) {
    // error determining sig size
}
```

\appendix

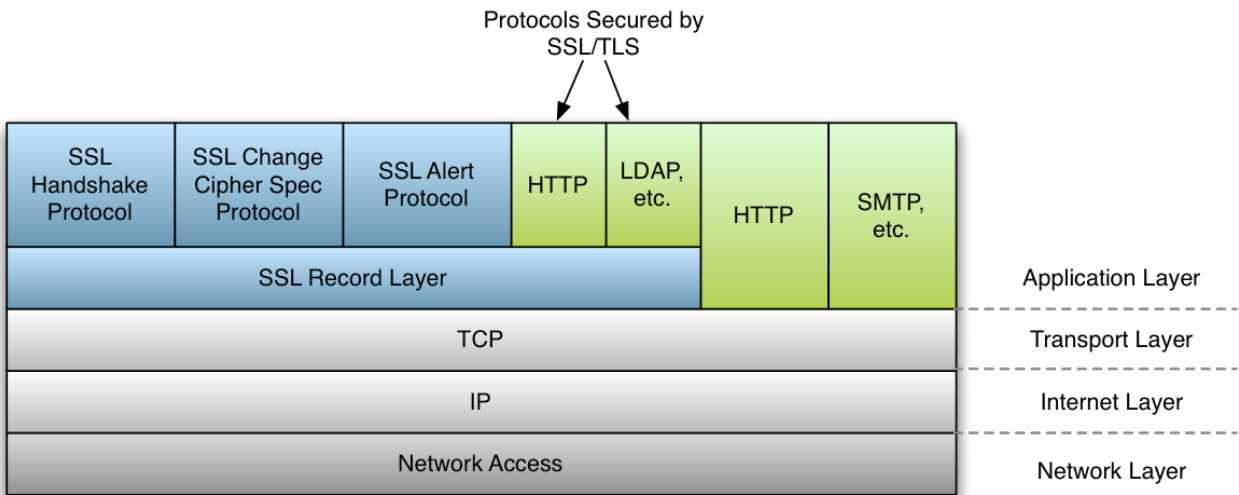

19 SSL/TLS Overview

19.1 General Architecture

The wolfSSL (formerly CyaSSL) embedded SSL library implements SSL 3.0, TLS 1.0, TLS 1.1, TLS 1.2, and TLS 1.3 protocols. TLS 1.3 is currently the most secure and up to date version of the standard. wolfSSL does not support SSL 2.0 due to the fact that it has been insecure for several years.

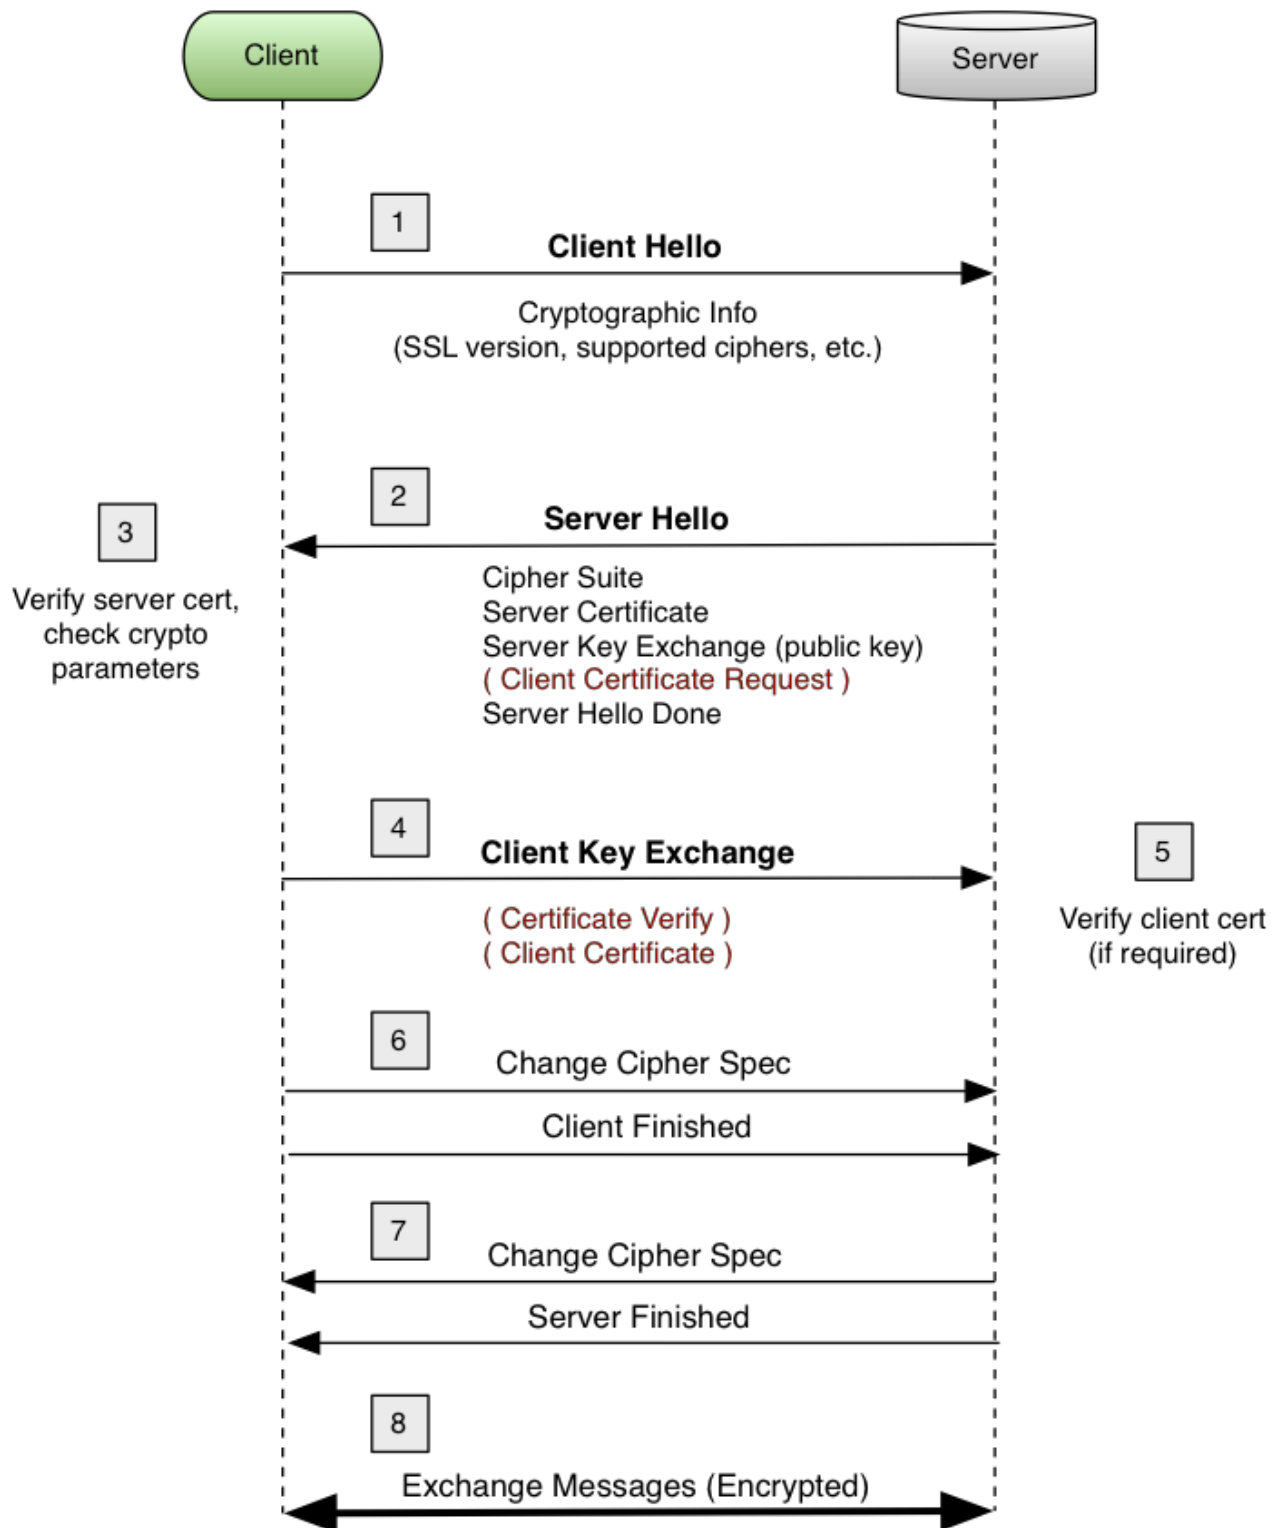

The TLS protocol in wolfSSL is implemented as defined in [RFC 5246 \(https://tools.ietf.org/html/rfc5246\)](https://tools.ietf.org/html/rfc5246). Two record layer protocols exist within SSL - the message layer and the handshake layer. Handshake messages are used to negotiate a common cipher suite, create secrets, and enable a secure connection. The message layer encapsulates the handshake layer while also supporting alert processing and application data transfer.

A general diagram of how the SSL protocol fits into existing protocols can be seen in **Figure 1**. SSL sits in between the Transport and Application layers of the OSI model, where any number of protocols (including TCP/IP, Bluetooth, etc.) may act as the transport medium. Application protocols are layered on top of SSL (such as HTTP, FTP, and SMTP).

19.2 SSL Handshake

The SSL handshake involves several steps, some of which are optional depending on what options the SSL client and server have been configured with. Below, in **Figure 2**, you will find a simplified diagram of the SSL handshake process.

19.3 Differences between SSL and TLS Protocol Versions

SSL (Secure Sockets Layer) and TLS (Transport Security Layer) are both cryptographic protocols which provide secure communication over networks. These two protocols (and the several versions of each) are in widespread use today in applications ranging from web browsing to e-mail to instant messaging

and VoIP. Each protocol, and the underlying versions of each, are slightly different from the other.

Below you will find both an explanation of, and the major differences between the different SSL and TLS protocol versions. For specific details about each protocol, please reference the RFC specification mentioned.

19.3.1 SSL 3.0

This protocol was released in 1996 but began with the creation of SSL 1.0 developed by Netscape. Version 1.0 wasn't released, and version 2.0 had a number of security flaws, thus leading to the release of SSL 3.0. Some major improvements of SSL 3.0 over SSL 2.0 are:

- Separation of the transport of data from the message layer
- Use of a full 128 bits of keying material even when using the Export cipher
- Ability of the client and server to send chains of certificates, thus allowing organizations to use certificate hierarchy which is more than two certificates deep.
- Implementing a generalized key exchange protocol, allowing Diffie-Hellman and Fortezza key exchanges as well as non-RSA certificates.
- Allowing for record compression and decompression
- Ability to fall back to SSL 2.0 when a 2.0 client is encountered

19.3.2 TLS 1.0

This protocol was first defined in RFC 2246 in January of 1999. This was an upgrade from SSL 3.0 and the differences were not dramatic, but they are significant enough that SSL 3.0 and TLS 1.0 don't interoperate. Some of the major differences between SSL 3.0 and TLS 1.0 are:

- Key derivation functions are different
- MACs are different - SSL 3.0 uses a modification of an early HMAC while TLS 1.0 uses HMAC.
- The Finished messages are different
- TLS has more alerts
- TLS requires DSS/DH support

19.3.3 TLS 1.1

This protocol was defined in RFC 4346 in April of 2006, and is an update to TLS 1.0. The major changes are:

- The Implicit Initialization Vector (IV) is replaced with an explicit IV to protect against Cipher block chaining (CBC) attacks.
- Handling of padded errors is changed to use the `bad_record_mac` alert rather than the `decryption_failed` alert to protect against CBC attacks.
- IANA registries are defined for protocol parameters
- Premature closes no longer cause a session to be non-resumable.

19.3.4 TLS 1.2

This protocol was defined in RFC 5246 in August of 2008. Based on TLS 1.1, TLS 1.2 contains improved flexibility. The major differences include:

- The MD5/SHA-1 combination in the pseudorandom function (PRF) was replaced with cipher-suite-specified PRFs.
- The MD5/SHA-1 combination in the digitally-signed element was replaced with a single hash. Signed elements include a field explicitly specifying the hash algorithm used.
- There was substantial cleanup to the client's and server's ability to specify which hash and signature algorithms they will accept.

- Addition of support for authenticated encryption with additional data modes.
- TLS Extensions definition and AES Cipher Suites were merged in.
- Tighter checking of EncryptedPreMasterSecret version numbers.
- Many of the requirements were tightened
- `Verify_data` length depends on the cipher suite
- Description of Bleichenbacher/Dlima attack defenses cleaned up.

19.3.5 TLS 1.3

This protocol was defined in RFC 8446 in August of 2018. TLS 1.3 contains improved security and speed. The major differences include:

- The list of supported symmetric algorithms has been pruned of all legacy algorithms. The remaining algorithms all use Authenticated Encryption with Associated Data (AEAD) algorithms.
- A zero-RTT (0-RTT) mode was added, saving a round-trip at connection setup for some application data at the cost of certain security properties.
- All handshake messages after the ServerHello are now encrypted.
- Key derivation functions have been re-designed, with the HMAC-based Extract-and-Expand Key Derivation Function (HKDF) being used as a primitive.
- The handshake state machine has been restructured to be more consistent and remove superfluous messages.
- ECC is now in the base spec and includes new signature algorithms. Point format negotiation has been removed in favor of single point format for each curve.
- Compression, custom DHE groups, and DSA have been removed, RSA padding now uses PSS.
- TLS 1.2 version negotiation verification mechanism was deprecated in favor of a version list in an extension.
- Session resumption with and without server-side state and the PSK-based ciphersuites of earlier versions of TLS have been replaced by a single new PSK exchange.

21 Error Codes

21.1 wolfSSL Error Codes

wolfSSL (formerly CyaSSL) error codes can be found in `wolfssl/ssl.h`. For detailed descriptions of the following errors, see the OpenSSL man page for `SSL_get_error` (man `SSL_get_error`).

Error Code Enum	Error Code	Error Description
SSL_ERROR_WANT_READ	2	
SSL_ERROR_WANT_WRITE	3	
SSL_ERROR_WANT_CONNECT	7	
SSL_ERROR_WANT_ACCEPT	8	
SSL_ERROR_SYSCALL	5	
SSL_ERROR_WANT_X509_LOOKUP	83	
SSL_ERROR_ZERO_RETURN	6	
SSL_ERROR_SSL	85	

Additional wolfSSL error codes can be found in `wolfssl/error-ssl.h`

Error Code Enum	Error Code	Error Description
INPUT_CASE_ERROR	-301	process input state error
PREFIX_ERROR	-302	bad index to key rounds

Error Code Enum	Error Code	Error Description
MEMORY_ERROR	-303	out of memory
VERIFY_FINISHED_ERROR	-304	verify problem on finished
VERIFY_MAC_ERROR	-305	verify mac problem
PARSE_ERROR	-306	parse error on header
UNKNOWN_HANDSHAKE_TYPE	-307	weird handshake type
SOCKET_ERROR_E	-308	error state on socket
SOCKET_NODATA	-309	expected data, not there
INCOMPLETE_DATA	-310	don't have enough data to complete task
UNKNOWN_RECORD_TYPE	-311	unknown type in record hdr
DECRYPT_ERROR	-312	error during decryption
FATAL_ERROR	-313	revcd alert fatal error
ENCRYPT_ERROR	-314	error during encryption
FREAD_ERROR	-315	fread problem
NO_PEER_KEY	-316	need peer's key
NO_PRIVATE_KEY	-317	need the private key
RSA_PRIVATE_ERROR	-318	error during rsa priv op
NO_DH_PARAMS	-319	server missing DH params
BUILD_MSG_ERROR	-320	build message failure
BAD_HELLO	-321	client hello malformed
DOMAIN_NAME_MISMATCH	-322	peer subject name mismatch
WANT_READ	-323	want read, call again
NOT_READY_ERROR	-324	handshake layer not ready
VERSION_ERROR	-326	record layer version error
WANT_WRITE	-327	want write, call again
BUFFER_ERROR	-328	malformed buffer input
VERIFY_CERT_ERROR	-329	verify cert error
VERIFY_SIGN_ERROR	-330	verify sign error
CLIENT_ID_ERROR	-331	psk client identity error
SERVER_HINT_ERROR	-332	psk server hint error
PSK_KEY_ERROR	-333	psk key error
GETTIME_ERROR	-337	gettimeofday failed ???
GETITIMER_ERROR	-338	getitimer failed ???
SIGACT_ERROR	-339	sigaction failed ???
SETITIMER_ERROR	-340	setitimer failed ???
LENGTH_ERROR	-341	record layer length error
PEER_KEY_ERROR	-342	cant decode peer key
ZERO_RETURN	-343	peer sent close notify
SIDE_ERROR	-344	wrong client/server type
NO_PEER_CERT	-345	peer didn't send key
NTRU_KEY_ERROR	-346	NTRU key error
NTRU_DRBG_ERROR	-347	NTRU drbg error
NTRU_ENCRYPT_ERROR	-348	NTRU encrypt error
NTRU_DECRYPT_ERROR	-349	NTRU decrypt error
ECC_CURVETYPE_ERROR	-350	Bad ECC Curve Type
ECC_CURVE_ERROR	-351	Bad ECC Curve
ECC_PEERKEY_ERROR	-352	Bad Peer ECC Key
ECC_MAKEKEY_ERROR	-353	Bad Make ECC Key
ECC_EXPORT_ERROR	-354	Bad ECC Export Key
ECC_SHARED_ERROR	-355	Bad ECC Shared Secret
NOT_CA_ERROR	-357	Not CA cert error
BAD_CERT_MANAGER_ERROR	-359	Bad Cert Manager
OCSF_CERT_REVOKED	-360	OCSF Certificate revoked

Error Code Enum	Error Code	Error Description
CRL_CERT_REVOKED	-361	CRL Certificate revoked
CRL_MISSING	-362	CRL Not loaded
MONITOR_SETUP_E	-363	CRL Monitor setup error
THREAD_CREATE_E	-364	Thread Create Error
OCSP_NEED_URL	-365	OCSP need an URL for lookup
OCSP_CERT_UNKNOWN	-366	OCSP responder doesn't know
OCSP_LOOKUP_FAIL	-367	OCSP lookup not successful
MAX_CHAIN_ERROR	-368	max chain depth exceeded
COOKIE_ERROR	-369	dtls cookie error
SEQUENCE_ERROR	-370	dtls sequence error
SUITES_ERROR	-371	suites pointer error
OUT_OF_ORDER_E	-373	out of order message
BAD_KEYA_TYPE_E	-374	bad KEA type found
SANITY_CIPHER_E	-375	sanity check on cipher error
RECV_OVERFLOW_E	-376	RXCB returned more than rqed
GEN_COOKIE_E	-377	Generate Cookie Error
NO_PEER_VERIFY	-378	Need peer cert verify Error
FWRITE_ERROR	-379	fwrite problem
CACHE_MATCH_ERROR	-380	cache hrd match error
UNKNOWN_SNI_HOST_NAME_E	-381	Unrecognized host name Error
UNKNOWN_MAX_FRAG_LEN_E	-382	Unrecognized max frag len Error
KEYUSE_SIGNATURE_E	-383	KeyUse digSignature error
KEYUSE_ENCRYPT_E	-385	KeyUse KeyEncipher error
EXTKEYUSE_AUTH_E	-386	ExtKeyUse server
SEND_OOB_READ_E	-387	Send Cb out of bounds read
SECURE_RENEGOTIATION_E	-388	Invalid renegotiation info
SESSION_TICKET_LEN_E	-389	Session Ticket too large
SESSION_TICKET_EXPECT_E	-390	Session Ticket missing
SCR_DIFFERENT_CERT_E	-391	SCR Different cert error
SESSION_SECRET_CB_E	-392	Session secret CB fcn failure
NO_CHANGE_CIPHER_E	-393	Finished before change cipher
SANITY_MSG_E	-394	Sanity check on msg order error
DUPLICATE_MST_E	-395	Duplicate message error
SNI_UNSUPPORTED	-396	SSL 3.0 does not support SNI
SOCKET_PEER_CLOSED_E	-397	Underlying transport closed
BAD_TICKET_KEY_CB_SZ	-398	Bad session ticket key cb size
BAD_TICKET_MSG_SZ	-399	Bad session ticket msg size
BAD_TICKET_ENCRYPT	-400	Bad user ticket encrypt
DH_KEY_SIZE_E	-401	DH key too small
SNI_ABSENT_ERROR	-402	No SNI request
RSA_SIGN_FAULT	-403	RSA sign fault
HANDSHAKE_SIZE_ERROR	-404	Handshake message too large
UNKNOWN_ALPN_PROTOCOL_NAME_E	-405	Unrecognized protocol name error
BAD_CERTIFICATE_STATUS_ERROR	-406	Bad certificate status message
OCSP_INVALID_STATUS	-407	Invalid OCSP status
OCSP_WANT_READ	-408	OCSP callback response
RSA_KEY_SIZE_E	-409	RSA key too small
ECC_KEY_SIZE_E	-410	ECC key too small
DTLS_EXPORT_VER_E	-411	Export version error
INPUT_SIZE_E	-412	Input size too big error
CTX_INIT_MUTEX_E	-413	Initialize ctx mutex error
EXT_MASTER_SECRET_NEEDED_E	-414	Need EMS enabled to resume

Error Code Enum	Error Code	Error Description
DTLS_POOL_SZ_E	-415	Exceeded DTLS pool size
DECODE_E	-416	Decode handshake message error
HTTP_TIMEOUT	-417	HTTP timeout for OCSP or CRL req
WRITE_DUP_READ_E	-418	Write dup write side can't read
WRITE_DUP_WRITE_E	-419	Write dup read side can't write
INVALID_CERT_CTX_E	-420	TLS cert ctx not matching
BAD_KEY_SHARE_DATA	-421	Key share data invalid
MISSING_HANDSHAKE_DATA	-422	Handshake message missing data
BAD_BINDER	-423	Binder does not match
EXT_NOT_ALLOWED	-424	Extension not allowed in msg
INVALID_PARAMETER	-425	Security parameter invalid
MCAST_HIGHWATER_CB_E	-426	Multicast highwater cb err
ALERT_COUNT_E	-427	Alert count exceeded err
EXT_MISSING	-428	Required extension not found
UNSUPPORTED_EXTENSION	-429	TLSX not requested by client
PRF_MISSING	-430	PRF not compiled in
DTLS_RETX_OVER_TX	-431	Retransmit DTLS flight over
DH_PARAMS_NOT_FFDHE_E	-432	DH params from server not FFDHE
TCA_INVALID_ID_TYPE	-433	TLSX TCA ID type invalid
TCA_ABSENT_ERROR	-434	TLSX TCA ID no response

Negotiation Parameter Errors

Error Code Enum	Error Code	Error Description
UNSUPPORTED_SUITE	-500	Unsupported cipher suite
MATCH_SUITE_ERROR	-501	Can't match cipher suite
COMPRESSION_ERROR	-502	Compression mismatch
KEY_SHARE_ERROR	-503	Key share mismatch
POST_HAND_AUTH_ERROR	-504	Client won't do post-hand auth
HRR_COOKIE_ERROR	-505	HRR msg cookie mismatch

21.2 wolfCrypt Error Codes

wolfCrypt error codes can be found in `wolfssl/wolfcrypt/error.h`.

Error Code Enum	Error Code	Error Description
OPEN_RAN_E	-101	opening random device error
READ_RAN_E	-102	reading random device error
WINCRIPT_E	-103	windows crypt init error
CRYPTGEN_E	-104	windows crypt generation error
RAN_BLOCK_E	-105	reading random device would block
BAD_MUTEX_E	-106	Bad mutex operation
MP_INIT_E	-110	mp_init error state
MP_READ_E	-111	mp_read error state
MP_EXPTMOD_E	-112	mp_exptmod error state
MP_TO_E	-113	mp_to_xxx error state, can't convert
MP_SUB_E	-114	mp_sub error state, can't subtract
MP_ADD_E	-115	mp_add error state, can't add
MP_MUL_E	-116	mp_mul error state, can't multiply

Error Code Enum	Error Code	Error Description
MP_MULMOD_E	-117	mp_mulmod error state, can't multiply mod
MP_MOD_E	-118	mp_mod error state, can't mod
MP_INVMOD_E	-119	mp_invmod error state, can't inv mod
MP_CMP_E	-120	mp_cmp error state
MP_ZERO_E	-121	got a mp zero result, not expected
MEMORY_E	-125	out of memory error
RSA_WRONG_TYPE_E	-130	RSA wrong block type for RSA function
RSA_BUFFER_E	-131	RSA buffer error, output too small or input too large
BUFFER_E	-132	output buffer too small or input too large
ALGO_ID_E	-133	setting algo id error
PUBLIC_KEY_E	-134	setting public key error
DATE_E	-135	setting date validity error
SUBJECT_E	-136	setting subject name error
ISSUER_E	-137	setting issuer name error
CA_TRUE_E	-138	setting CA basic constraint true error
EXTENSIONS_E	-139	setting extensions error
ASN_PARSE_E	-140	ASN parsing error, invalid input
ASN_VERSION_E	-141	ASN version error, invalid number
ASN_GETINT_E	-142	ASN get big int error, invalid data
ASN_RSA_KEY_E	-143	ASN key init error, invalid input
ASN_OBJECT_ID_E	-144	ASN object id error, invalid id
ASN_TAG_NULL_E	-145	ASN tag error, not null
ASN_EXPECT_0_E	-146	ASN expect error, not zero
ASN_BITSTR_E	-147	ASN bit string error, wrong id
ASN_UNKNOWN_OID_E	-148	ASN oid error, unknown sum id
ASN_DATE_SZ_E	-149	ASN date error, bad size
ASN_BEFORE_DATE_E	-150	ASN date error, current date before
ASN_AFTER_DATE_E	-151	ASN date error, current date after
ASN_SIG_OID_E	-152	ASN signature error, mismatched oid
ASN_TIME_E	-153	ASN time error, unknown time type
ASN_INPUT_E	-154	ASN input error, not enough data
ASN_SIG_CONFIRM_E	-155	ASN sig error, confirm failure
ASN_SIG_HASH_E	-156	ASN sig error, unsupported hash type
ASN_SIG_KEY_E	-157	ASN sig error, unsupported key type
ASN_DH_KEY_E	-158	ASN key init error, invalid input
ASN_NTRU_KEY_E	-159	ASN ntru key decode error, invalid input
ASN_CRIT_EXT_E	-160	ASN unsupported critical extension
ECC_BAD_ARG_E	-170	ECC input argument of wrong type
ASN_ECC_KEY_E	-171	ASN ECC bad input
ECC_CURVE_OID_E	-172	Unsupported ECC OID curve type
BAD_FUNC_ARG	-173	Bad function argument provided
NOT_COMPILED_IN	-174	Feature not compiled in
UNICODE_SIZE_E	-175	Unicode password too big
NO_PASSWORD	-176	no password provided by user
ALT_NAME_E	-177	alt name size problem, too big
AES_GCM_AUTH_E	-180	AES-GCM Authentication check failure
AES_CCM_AUTH_E	-181	AES-CCM Authentication check failure
CAVIUM_INIT_E	-182	Cavium Init type error
COMPRESS_INIT_E	-183	Compress init error
COMPRESS_E	-184	Compress error
DECOMPRESS_INIT_E	-185	DeCompress init error
DECOMPRESS_E	-186	DeCompress error

Error Code Enum	Error Code	Error Description
BAD_ALIGN_E	-187	Bad alignment for operation, no alloc
ASN_NO_SIGNER_E	-188	ASN sig error, no CA signer to verify certificate
ASN_CRL_CONFIRM_E	-189	ASN CRL no signer to confirm failure
ASN_CRL_NO_SIGNER_E	-190	ASN CRL no signer to confirm failure
ASN_OCSP_CONFIRM_E	-191	ASN OCSP signature confirm failure
BAD_ENC_STATE_E	-192	Bad ecc enc state operation
BAD_PADDING_E	-193	Bad padding, msg not correct length
REQ_ATTRIBUTE_E	-194	Setting cert request attributes error
PKCS7_OID_E	-195	PKCS#7, mismatched OID error
PKCS7_RECIP_E	-196	PKCS#7, recipient error
FIPS_NOT_ALLOWED_E	-197	FIPS not allowed error
ASN_NAME_INVALID_E	-198	ASN name constraint error
RNG_FAILURE_E	-199	RNG Failed, Reinitialize
HMAC_MIN_KEYLEN_E	-200	FIPS Mode HMAC Minimum Key Length error
RSA_PAD_E	-201	RSA Padding Error
LENGTH_ONLY_E	-202	Returning output length only
IN_CORE_FIPS_E	-203	In Core Integrity check failure
AES_KAT_FIPS_E	-204	AES KAT failure
DES3_KAT_FIPS_E	-205	DES3 KAT failure
HMAC_KAT_FIPS_E	-206	HMAC KAT failure
RSA_KAT_FIPS_E	-207	RSA KAT failure
DRBG_KAT_FIPS_E	-208	HASH DRBG KAT failure
DRBG_CONT_FIPS_E	-209	HASH DRBG Continuous test failure
AESGCM_KAT_FIPS_E	-210	AESGCM KAT failure
THREAD_STORE_KEY_E	-211	Thread local storage key create failure
THREAD_STORE_SET_E	-212	Thread local storage key set failure
MAC_CMP_FAILED_E	-213	MAC comparison failed
IS_POINT_E	-214	ECC is point on curve failed
ECC_INF_E	-215	ECC point infinity error
ECC_PRIV_KEY_E	-216	ECC private key not valid error
SRP_CALL_ORDER_E	-217	SRP function called in the wrong order
SRP_VERIFY_E	-218	SRP proof verification failed
SRP_BAD_KEY_E	-219	SRP bad ephemeral values
ASN_NO_SKID	-220	ASN no Subject Key Identifier found
ASN_NO_AKID	-221	ASN no Authority Key Identifier found
ASN_NO_KEYUSAGE	-223	ASN no Key Usage found
SKID_E	-224	Setting Subject Key Identifier error
AKID_E	-225	Setting Authority Key Identifier error
KEYUSAGE_E	-226	Bad Key Usage value
CERTPOLICIES_E	-227	Setting Certificate Policies error
WC_INIT_E	-228	wolfCrypt failed to initialize
SIG_VERIFY_E	-229	wolfCrypt signature verify error
BAD_PKCS7_SIGNEEDS_CHECKCOND_E	-230	Bad condition variable operation
SIG_TYPE_E	-231	Signature Type not enabled/available
HASH_TYPE_E	-232	Hash Type not enabled/available
WC_KEY_SIZE_E	-234	Key size error, either too small or large
ASN_COUNTRY_SIZE_E	-235	ASN Cert Gen, invalid country code size
MISSING_RNG_E	-236	RNG required but not provided
ASN_PATHLEN_SIZE_E	-237	ASN CA path length too large error
ASN_PATHLEN_INV_E	-238	ASN CA path length inversion error
BAD_KEYWRAP_ALG_E	-239	Algorithm error with keywrap
BAD_KEYWRAP_IV_E	-240	Decrypted AES key wrap IV incorrect

Error Code Enum	Error Code	Error Description
WC_CLEANUP_E	-241	wolfCrypt cleanup failed
ECC_CDH_KAT_FIPS_E	-242	ECC CDH known answer test failure
DH_CHECK_PUB_E	-243	DH check public key error
BAD_PATH_ERROR	-244	Bad path for opendir
ASYNC_OP_E	-245	Async operation error
ECC_PRIVATEONLY_E	-246	Invalid use of private only ECC key
EXTKEYUSAGE_E	-247	Bad extended key usage value
WC_HW_E	-248	Error with hardware crypto use
WC_HW_WAIT_E	-249	Hardware waiting on resource
PSS_SALTLEN_E	-250	PSS length of salt is too long for hash
PRIME_GEN_E	-251	Failure finding a prime
BER_INDEF_E	-252	Cannot decode indefinite length BER
RSA_OUT_OF_RANGE_E	-253	Ciphertext to decrypt out of range
RSAPSS_PAT_FIPS_E	-254	RSA-PSS PAT failure
ECDSA_PAT_FIPS_E	-255	ECDSA PAT failure
DH_KAT_FIPS_E	-256	DH KAT failure
AESCCM_KAT_FIPS_E	-257	AESCCM KAT failure
SHA3_KAT_FIPS_E	-258	SHA-3 KAT failure
ECDHE_KAT_FIPS_E	-259	ECDHE KAT failure
AES_GCM_OVERFLOW_E	-260	AES-GCM invocation counter overflow
AES_CCM_OVERFLOW_E	-261	AES-CCM invocation counter overflow
RSA_KEY_PAIR_E	-262	RSA Key Pair-Wise consistency check fail
DH_CHECK_PRIVATE_E	-263	DH check private key error
WC_AFALG_SOCKET_E	-264	AF_ALG socket error
WC_DEVCRYPTO_E	-265	/dev/crypto error
ZLIB_INIT_ERROR	-266	Zlib init error
ZLIB_COMPRESS_ERROR	-267	Zlib compression error
ZLIB_DECOMPRESS_ERROR	-268	Zlib decompression error
PKCS7_NO_SIGNER_E	-269	No signer in PKCS7 signed data msg
WC_PKCS7_WANT_READ_E	-270	PKCS7 stream operation wants more input
CRYPTOCB_UNAVAILABLE	-271	Crypto callback unavailable
PKCS7_SIGNEEDS_CHECK	-272	Signature needs verified by caller
ASN_SELF_SIGNED_E	-273	ASN self-signed certificate error
MIN_CODE_E	-300	errors -101 - -299

21.3 Common Error Codes and their Solution

There are several error codes that commonly happen when getting an application up and running with wolfSSL.

21.3.1 ASN_NO_SIGNER_E (-188)

This error occurs when using a certificate and the signing CA certificate was not loaded. This can be seen using the wolfSSL example server or client against another client or server, for example connecting to Google using the wolfSSL example client:

```
$ ./examples/client/client -g -h www.google.com -p 443
```

This fails with error -188 because Google's CA certificate wasn't loaded with the "-A" command line option.

21.3.2 WANT_READ (-323)

The WANT_READ error happens often when using non-blocking sockets, and isn't actually an error when using non-blocking sockets, but it is passed up to the caller as an error. When a call to receive data from the I/O callback would block as there isn't data currently available to receive, the I/O callback returns WANT_READ. The caller should wait and try receiving again later. This is usually seen from calls to `wolfSSL_read()`, `wolfSSL_negotiate()`, `wolfSSL_accept()`, and `wolfSSL_connect()`. The example client and server will indicate the WANT_READ incidents when debugging is enabled.
